Abstract: This study aims to find: training models, teaching materials, and methods for socializing and implementing models that can be a reference used to train farmers to carry out integrated pest control (IPM) as an effort to increase production and sustainable income in technical irrigation areas. Research location in the technical irrigation area of South Sulawesi Province. Research respondents were selected by purposive method, as many as 300 people. The research variables are: training model, teaching material, socialization method, and application of integrated pest control model. Data collection is done by giving questionnaires to respondents. Validation of models and teaching materials is carried out by relevant experts. The data analysis technique used is descriptive qualitative analysis. The results of the study are: Integrated pest control training model in technical irrigation areas, consisting of seven steps, namely: 1) needs analysis, 2) determining teaching material, 3) formulating objectives, 4) developing and validating materials, 5) preparing tests, 6) carry out training, and 7) conduct an evaluation.

Keywords: Training Model, Integrated Pest Eradication, Technical Irrigation Area, Teaching Material, and Farmers

1. Introduction

The Technical Irrigation Area is a sub system of the overall ecosystem structure, and is a built environment for farmers. The area of Technical Irrigation, a state investment that is of enormous value, is a target area for farmers to try farming. The Law of the Republic of Indonesia Number 32 of concerning Environmental Protection and Management explains that everyone has the right to a good environment and must maintain and preserve it [1]. Affandi, said that: Environment, which is a unity of space with all objects, power, conditions, and living things, including humans and their behavior, which affects the continuity of life and welfare of humans and other living things, due to the fact that shows that the level of environmental damage is very high and tend to get higher, relatively easy to find. [2].

Minister of the Environment Regulation No. 01, About Management of Water Pollution Control explained that the use of chemicals for controlling insects, pests, weeds, and fungi in agricultural areas has increased the productivity of

farming [3]. Brundtland, states that excessive use of chemicals threatens the lives of humans and other species [4]. Ithof said that: One of the efforts of humans in the context of caring for the environment is to limit human behavior in each of its activities in accordance with the contents contained in the Law on the Environment, so that between humans and nature there is a balance that is always maintained and preserved. Human behavior that always cares about the environment, one aspect, can be realized [5] Muhammad Ardi's, research about several factors that influence the behavior of farmers in farming and preserving the environment in several irrigation areas in South Sulawesi Province [6]. The results showed that the behavior of farmers is strongly influenced by: issues of knowledge, attitudes, and motivation to care for the environment. Research by Muhammad Ardi and Faizal Amir, in the wet farming area of Soppeng Regency, found that environmental knowledge, attitudes, and behavior of farmers preserving the environment are classified as regions [7].

Goad in Hanrahmawan, developed a training model

through several stages whose cycle consisted of: (a) training needs analysis, (b) designing training approaches, (c) developing training materials, (d) conducting training, and (e) evaluating and repair training [8]. Banathy in Sanjaya, designed a learning program into six stages as follows: (a) analyzing and formulating objectives, (b) formulating test criteria, (c) analyzing and formulating learning activities, (d) designing systems, (e) implement, and (f) make improvements and changes based on evaluation [9]. Dick and Carey in Sanjaya (2011) designed a training model that began with: (a) identification of objectives, (b) formulating tests, (c) developing learning strategies according to objectives, and (d) conducting evaluations [9]. Soerjani, et al. states that the environment is a living system in which there is human intervention in the ecosystem [10].

Irrigation, according to Hariyanto, is networks are needed by farmers who need available resources (human, equipment, materials). To place resources, we need a model that influences the implementation of the use of irrigation in systematic detail, so that it can predict the running of the program. [11]. Pasandaran, states that the effort that needs to be done in the management of irrigation water is the regulation and provision of water according to the needs of the plant or farming effort being pursued [12]. Anwar Adilaga, states that conservation farming is a farming business that pays attention to erosion prevention, such as: (1) maintaining the recycling of soil organic matter so that it can be maintained at a level that benefits plants, (2) maintaining and increasing soil fertility by providing fertilizer in accordance with the needs of farming and soil conditions, and (3) using land according to his ability [13]. Marchel, states that farming is the study of how to allocate resources owned by farmers to run effectively and efficiently, and utilize these resources in order to obtain the highest profit [14].

Oka, states that integrated pest control (IPM) or integrated pest control (IPC) is pest management that uses all appropriate techniques and methods in harmonious and harmonious ways and maintains pest populations below the level that causes economic damage. in environmental conditions and population dynamics of the pest species concerned [15]. Marry and Robert, states that integrated pest control (IPM) should be understood as an ecology-based pest control strategy that focuses on natural mortality factors such as natural enemies and weather and seeks to control tactics that disrupt these factors to a minimum [16]. Untung (2006) states that the use of pesticides is the last alternative. Furthermore it is said that the application of IPM refers to four principles, namely: (1) Healthy plant cultivation, (2) Conservation of natural enemies, (3) Regular ecosystem monitoring, and (4) Farmers as determinants of control decisions or as IPM experts [17].

2. Research Methods

The research approach is research development. The stages of the research are as follows: (1) conducting survey research

to study and find training models and teaching materials in conducting integrated pest eradication; (2) developing teaching materials found relating to the eradication of integrated pests as an effort to increase farm production and sustainable farmers' income in technical irrigation areas. The research location is the technical irrigation area of South Sulawesi Province. The sample area was chosen by purposive sampling method, namely Saddang irrigation area, Langkemme irrigation area, and Bantimurung irrigation area. The research respondents were selected by purposive method, as many as 300 people. Data collection is done by giving questionnaires. Validation of models and teaching materials is carried out by relevant experts. Analysis of the data used is qualitative descriptive analysis.

3. Results and Discussion

3.1. Training Model that Can Be a Reference in Fostering Farmers Conducting IPM as an Effort to Increase Production and Income in a Sustainable Manner

3.1.1. Conduct a Needs Analysis

The results of an analysis of 300 samples showed that 17.33% expressed strongly agree, and 82.67% agreed. It can be concluded that conducting a needs analysis is the first step in determining a training model. Analysis of training needs is very important to know before designing training. Needs analysis is the basis for developing training materials for farmers conducting IPM. These findings are in line with Hanrahmawan's, model which states that needs analysis is the first step in formulating a training model [8].

3.1.2. Determine Teaching Material

The analysis of 300 samples showed that 30% expressed strongly agree, strongly agreed, 68% agreed, and 2% expressed doubt. It can be concluded that determining the teaching material is the second step in determining the training model. Training material is the main and important element in a training activity for farmers conducting IPM. This finding is in line with Nadler, who developed a training model known as The Critical Events Model (CEM) or called the open training model, in which one step is to determine teaching material [18].

3.1.3. Formulate Learning Objectives

The analysis of 300 samples showed that 18% stated strongly agree stated strongly agreed, 73.34% stated agreed, 4% expressed doubt, and 0.33% stated disagreed. It can be concluded that formulating learning objectives is the third step in determining the training model. The learning objectives are the directors in a training activity for farmers conducting IPM. This finding is in line with Djudju Sudjana's statement, which states that one of the steps in determining the training model is to formulate learning objectives [19].

3.1.4. Develop and Validate Material

The results of an analysis of 300 samples showed that 22.33% stated strongly agreed stated strongly agreed, 78%

stated agreed, 2.67% expressed doubt, and 1.33% stated disagreed. It can be concluded that developing and validating teaching materials is the fourth step in determining the training model for farmers conducting IPM.

3.1.5. Formulate and Arrange Tests

The results of an analysis of 300 samples showed that 22.33% stated strongly agreed, 75.67% stated agreed, and 2% expressed doubt. It can be concluded that formulating and compiling tests is the fifth step in determining the training model for farmers conducting IPM. The findings of this study are in line with what was stated by Djudju Sudjana, which states that one of the steps in determining the training model is to formulate and arrange tests so that the success of the training can be measured [19].

3.1.6. Carry Out Counseling and Training

The results of an analysis of 300 samples showed that as many as 26% expressed strongly agree, 73% stated agreed, and 1% stated disagreed. It can be concluded that conducting counseling and training is the sixth step in determining the training model for farmers conducting IPM. These findings are in line with the explanation of Hanrahmawan, which states that one of the steps in determining the training model is conduct the training [8].

3.1.7. Conduct an Evaluation

The analysis of 300 samples shows that 24% expressed strongly agree, 76% agree. It can be concluded that conducting an evaluation is a step in determining the training model for farmers conducting IPM. These findings are in line with the model of Hanrahmawan, and Djudju Sudjana, which states that one of the steps in determining the training model is to conduct an evaluation. The evaluation aims to measure the success of training participants while simultaneously measuring the effectiveness and efficiency of the training model applied [8], [19].

3.2. Teaching Material Needed by Farmers in Conducting IPM in an Effort to Increase Production and Income in a Sustainable Manner

3.2.1. Material on Integrated Pest Eradication

The results of an analysis of 300 samples showed that 17.67% stated strongly agree, 79.67% stated agreed, and 2.66% expressed doubt. It can be concluded that integrated pest eradication material in wet farming areas is needed by farmers in conducting IPM. The material, it is important given to farmers so that their understanding of pest eradication in an integrated manner can increase.

3.2.2. Material About the Types of Pesticides

The analysis of 300 samples shows that 21% expressed strongly agree, 75% stated agree, and 4% expressed doubt. It can be concluded that the material about the types of pesticides is needed by farmers in conducting

IPM. The material is very important given to farmers so that farmers have insight into the types of pesticides in farming.

3.2.3. Material About Plants that Can Be Used as Natural Pesticides

The results of an analysis of 300 samples showed that 17.67% stated strongly agree, 78.67% stated agreed, and 3.66% expressed doubt. It can be concluded that material about plant types that can be used as natural pesticides is needed by farmers in conducting IPM in an effort to increase production and income in a sustainable manner in technical irrigation areas. The material is very important given to farmers so that farmers can take advantage of farming.

3.2.4. Material About the Dose of Chemical Pesticides

The results of the analysis of 300 samples showed that 27.33% stated strongly agreed, 72.67% agreed. It can be concluded that the material about the dose of chemical pesticides is needed by farmers in conducting IPM. The material is very important given to farmers so that farmers do not use it wrongly in farming.

3.2.5. Material About Environmentally Friendly Pesticides

The analysis of 300 samples shows that 32% expressed strongly agree, 65% agreed, and 3% expressed doubt. It can be concluded that materials about environmentally friendly pesticides are needed by farmers in conducting IPM. The material is very important given to farmers so that farmers do not choose chemical pesticides in farming.

3.2.6. Material on How to Use Pesticides

The analysis of 300 samples showed that 29% agreed strongly, and 71% agreed. It can be concluded that the material on how to use pesticides is needed by farmers in conducting IPM. The material is very important given to farmers so that farmers do not use chemical pesticides wrong in farming.

3.2.7. Material About Pests and Types of Pests

The results of the analysis of 300 samples showed that as much as 41.33% stated strongly agreed, 58.67 stated agreed. It can be concluded that the material about pests and types of pests needed by farmers in conducting IPM. The material is very important given to farmers so that farmers can identify pests and types of pests in farming.

3.3. Methods, Socializing and Applying Training Models for Farmers in Conducting IPM

3.3.1. Introduce the Contents of the Training Material

The results of an analysis of 300 samples showed that 32.33% stated strongly agreed, 63.67% stated agreed, and 4% expressed doubt. It can be concluded that introducing the contents of the training material to relevant stakeholders is the first step that must be taken in socializing and implementing a training model for farmers in

conducting IPM.

3.3.2. Communicating the Objectives and Benefits of the Training

The results of an analysis of 300 samples showed that 33% stated strongly agree, 64% stated agreed, and 3% expressed doubt. It can be concluded that conveying the objectives and benefits of training to relevant stakeholders is the second step that must be taken in socializing and implementing a training model for farmers in conducting IPM.

3.3.3. Selecting Training Participants

The results of an analysis of 300 samples showed that 22.67% stated strongly agreed, 75.67% stated agreed, and 1.66% expressed doubt. It can be concluded that selecting training participants is the third step that must be taken in socializing and applying training models for farmers in conducting IPM.

3.3.4. Determine the Training Schedule and Place

The results of the analysis of 300 samples showed that 32.33% stated strongly agreed, 61% stated agreed, and 6.67% expressed doubt. It can be concluded that determining the schedule and place of training is the fourth step that must be taken in socializing and implementing a training model for farmers in conducting IPM.

3.3.5. Determine the Number of Training Participants

The results of an analysis of 300 samples showed that 41.33% stated strongly agreed, 54.67% stated agreed, and 4% expressed doubt. It can be concluded that determining the number of training participants is the fifth step that must be taken in socializing and implementing a training model for farmers in conducting IPM.

3.3.6. Provide Direction to the Trainees

The results of an analysis of 300 samples showed that 39% stated strongly agree, 55% stated agreed, and 6% expressed doubt. It can be concluded that giving direction to trainees is the sixth step that must be taken in socializing and implementing training models for farmers in conducting IPM.

3.3.7. Distributing Material to Trainees

The results of an analysis of 300 samples showed that as much as 40.67% expressed strongly agree, and 59.33% stated agreed. It can be concluded that distributing material to trainees is the seventh step that must be taken in socializing and applying training models for farmers in conducting IPM.

3.3.8. Carry out Training

The analysis of 300 samples shows that 43% strongly agree, 57% agree, and 0% expressed doubt. It can be concluded that conducting training to trainees is the eighth step that must be carried out in socializing and applying training models for farmers in conducting IPM.

3.3.9. Conduct an Assessment

The analysis of 300 samples shows that 52% strongly agree, 48% agree, and 0% expressed doubt. It can be concluded that conducting an assessment is the ninth step that must be done in socializing and implementing a training model for farmers in conducting IPM.

3.3.10. Conduct an Evaluation

The results of an analysis of 300 samples showed that 41.33% stated strongly agreed, 56.67% stated agreed, and 2% expressed doubt. It can be concluded that conducting an evaluation is the tenth step that must be carried out in socializing and implementing a training model for farmers in conducting IPM.

4. Conclusion

The conclusions of this study are: 1) Training model that can be a reference in training farmers to carry out integrated pest control in an effort to increase production and income in a sustainable manner in technical irrigation areas, consisting of several steps, namely: conducting needs analysis, determining teaching material, formulating learning objectives, developing and validating teaching materials, formulating and compiling tests, conducting counseling and training, and conducting evaluations. 2) Teaching materials needed by farmers to improve environmental quality in a sustainable manner in technical irrigation areas, consisting of: integrated pest control knowledge, knowledge of types of pesticides, knowledge of plant types that can be made into natural pesticides, knowledge of the dose of chemical pesticides, knowledge of environmentally friendly pesticides, knowledge of how to use pesticides, knowledge of the impact of excessive use of pesticides on the physical environment, knowledge of the impact of the use of pesticides on health, and knowledge of the types of pests. 3) Steps taken to disseminate and implement training models for farmers to carry out integrated pest control in an effort to increase production and income in technical irrigation areas, consisting of: introducing the contents of training materials, conveying the objectives and benefits of training, selecting training participants, determining the schedule and place of training, determine the number of trainees, give direction to trainees, distribute materials to trainees, conduct training, conduct assessments, and conduct evaluations.
