Abstract: The training and academic performance of student nurses is the crux to having competent polyvalent nurses in the healthcare delivery system. This study sought to determine the perception of student nurses on the variables influencing academic achievement in Nnamdi Azikiwe University Nnewi Campus. A descriptive survey was used to elicit information from a sample of 108 respondents statistically drawn using stratified random sampling technique from a population of 146. Results indicated an overall poor academic performance. The significant variables that influence academic achievement as identified by the respondents were marital status, age, income, occupation and educational status of parents. Others include school location, basic amenities, stress, academic motivation, past academic records and study skills; learning approach, time management, group discussion and clinical experiences. The hypothesis revealed that there is a significant relationship between socioeconomic status of parents and the academic achievement of nursing students. Based on the findings, the researchers recommended that students, parents, teachers, administrators, policymakers and the government should make efforts to understand and examine these factors so as to initiate or make the necessary restructuring and interventions needed to revamp the academic performance of the students.

Keywords: Academic Performance, Student Nurses, Factors, Variables

1. Introduction

1.1. Background of the Study

The demand for qualified nurses in the health care system has led to several significant governments enquiries into issues associated with the recruitment and retention of nurses. These enquiries sought to understand the relationship between educational processes and preparation of student nurses for their eventual role in the nursing workforce [1, 2, 3].

Nursing education is an exciting and challenging adventure that demands much from nursing students, in terms of time and energy. Nursing students encounter complex situations and conflicts which constitute factors that affect

their academic performance which cannot be resolved only through theoretical knowledge and skills [4].

Over the years, discrepancies in the performance of nursing students have been observed, although students may be of comparable abilities, learn in the same environment and follow the same syllabus, their academic performance still vary. Bright students who fail to excel due to other factors, miss the opportunity to advance in education and to get employment [5]. Therefore, it is important to analyze variables of academic achievement due to its significant influence on learning at school.

Studies indicated that, student achievement and academic success are complex in nature and related to multiple variables [6]. In a broad sense, all students face some series

of challenges and stressors. But more likely, the nursing students are the ones who are at the center of experiencing stress [7]. Many factors have been identified to influence academic performance either positively or negatively [8], however, much of the recent research; indicated that academic motivation is an important underlying factor and component in learning. These identified factors which include; socioeconomic background [9, 10, 11], learning environment [11, 12], study skills [13, 14], socio-demographic variable [15], social factors [16] and past academic achievement [3] exert a degree of influence on academic achievement. The concomitant problems arising from these factors can lead to lack of motivation to study, poor attitude towards learning, lack of concentration, diverted attention and consequently poor performance [9].

This study focuses on identifying the perceived forms in which these factors influence the academic achievement of student nurses.

1.2. Statement of Problem

Nursing is one of the courses that attract thousands of students in Nigeria and worldwide. But not all students who enroll and study nursing finish their academic requirement and graduate as polyvalent nurse. One of the reasons of the high attrition rate is academic performance [9].

The escalating dwindling in the academic achievement rate of student nurses in Nigerian universities has undoubtedly become a social phenomenon and nursing educators in particular are becoming rather agitated.

A number of factors affect the academic performance of student nurses and may positively or negatively influence their academic achievement. In view of this, the present study, sought to investigate the perception of student nurses on the variables influencing their academic achievement in Nnamdi Azikiwe University, Nnewi Campus.

1.3. Objective of the Study

The main purpose of the study is to determine the perception of student nurses on the variables influencing their academic achievement in Nnamdi Azikiwe University, Nnewi Campus.

Specifically, objectives of this study include:

- I. to determine the overall academic performance of nursing science students of Nnamdi Azikiwe University.
- II. to determine the form in which socio-demographic factors influence academic achievement of nursing science students
- III. to determine the socio-economic variables of parent that influence the academic achievement of nursing science students.
- IV. to determine variables in the environment that influence academic achievement of nursing science students.
- V. to determine the psychological variables that influence the academic achievement of nursing

science students.

VI. to determine the influence of past academic performance on the academic achievement of nursing science students.

VII. to determine the study skills that influence the academic achievement of nursing science students.

1.4. Research Hypothesis

Ho: Parental socio-economic status does not significantly affect the academic achievement of the nursing student.

1.5. Limitations and Delimitations of Study

The study is limited to students in Nnewi campus of the University, from second year to final year. It is further delimited to the use of questionnaires for data collection and grade point Average (GPA) provided by the student as a measure of academic achievement.

2. Theoretical Framework

Maslow's Hierarchy of Needs

According to Maslow's theory of motivation, needs are the major factors in achieving motivation. He sought to explain it by reference to a 'hierarchy of human needs'. He believed that at any given moment a person's behavior is dominated by those of his needs which have great potency. As their lower physiological needs are adequately satisfied, motives at a higher level in the hierarchy come into play. The hierarchy is illustrated in figure 1 below [17].

Figure 1. Illustration of Maslow's hierarchy of needs.

In educational application, no learning will take place unless the students' basic needs are met. A student nurse who does not feed well, before going to school, lack good shelter or comfortable home, may be seriously affected in the course of learning. Such a learner looks dejected and unorganized, nor a student who is being bullied or sick feels safe to carryout academic activities effectively. Safety needs are protection against bodily harm, danger, deprivation or threat. Both adults and children tend to avoid various forms of perceived danger and unfamiliar situation. The next levels of need (love/belonging, self-esteem, and self-actualization) are

very important in the life of the student nurse/ learner because of the following benefits:

- I. It promotes positive self-concept.
- II. It promotes hard work in the course of learning.
- III. It provides student's academic performance.
- IV. It encourages positive change in the behavior of the student nurse.
- V. It contributes to improved teaching and learning process [9].

3. Methodology

3.1. Research Design

The study adopted a descriptive survey approach to determine the variables influencing academic achievement, among Nursing Science students in Nnamdi Azikiwe University.

3.2. Sample and Sampling Procedure

Using Yaro Yamane's formula, the sample size of 108 student nurses were selected using stratified random sampling technique. This was employed to ensure representation of the different levels of study from a target population of 146.

3.3. Instrument and Method of Data Collection

Self-structured questionnaire was used for data collection using the direct service system to ensure prompt return of the questionnaire. Based on the literature review variables of socio-demographic factor, socioeconomic status, psychological, environmental factors and variables related to study skills were used in structuring the questionnaire. Using Spearman Correlation Coefficient to determine the reliability estimate of the instrument based on split half method. The R_w value of 0.98 was gotten, hence instrument considered reliable for the study. The questionnaire elicited information on personal data, past academic achievement (CGPA), and perceived variables which influence their performance in school. At the end the return rate was 100%.

3.4. Method of Data Analysis

The data were analyzed Statistical Package for Social Science (SPSS version 16). Data were presented and described using frequency tables, bar chart, pie chart and simple percentage distribution. The null hypothesis was tested at 0.05 alpha level using Chi square statistical techniques.

3.5. Ethical Consideration

Approval was sought and obtained from the ethical committee in Nnamdi Azikiwe University Teaching Hospital. The researchers ensured that all information given by the respondents were treated with utmost confidentiality by maintaining anonymity.

4. Analysis and Discussion

4.1. Socio-demographic Characteristics of Respondents

Table 1. Showing socio-demographic characteristics.

Characteristic	Frequency	Percentage
1. Sex		
Male	15	13.9
Female	93	86.1
Total	108	100
2. Age	Frequency	Percentage
15-19	7	6.5
20-24	63	58.3
25-29	23	21.3
30-34	4	3.7
35+	11	10.2
Total	108	100
3. Marital Status	Frequency	Percentage
Single	86	79.6
Married	22	20.4
Divorced	0	0
Separated	0	0
Total	108	100

Data in Table 1 shows that the majority of the respondents 86.1% (93) were females, while 13.9% (15) of the respondents were males. Around 58.3% (63) of the respondents were between the age range of (20-24), while 21.3 % (23) were between (25-29), 10.2% (11) were (35 and above), 6.5% (7) were between (15-19) and 3.7% (4) were (30-34).

Distribution of the marital status as presented in Table 1 shows that greater percentage of the respondents 79.6% (86) were single while 20.4% (22) were married.

4.2. Academic Information of the Respondents

Figure 2. Distribution of Students' Percentage Based on Year of Study.

From Figure 2, the majority of the respondents 34.3% (37) were in their fourth year of study, 27.8% (30) were in their third year, 20.4% (22) were in their second year while 17.5% (19) were in their fifth year of study.

4.3. Research Questions

4.3.1. Academic Performance

What is the general academic performance of Nursing Science students in Nnamdi Azikiwe University, Nnewi Campus?

Table 2. Cumulative Grade Point Average of the respondents.

CGPA	Freq	Percentage	Remark
1.00-1.49	0	0.0	----
1.59-2.49	2	1.9	Very poor
2.50-3.49	43	39.8	Poor
3.50-4.49	44	40.9	High
4.50-5.00	6	5.6	Very high
Unknown	13	12.0	----
Total	108	100	Average Performance

The data in Table 2 Shows that the overall academic performance of the respondents is Poor. Specifically, 5.6% (6) of the respondent had very high performance with a 4.50-5.00 CGPA, 40.9% (44) of the respondent had a high performance with a CGPA between 3.50-4.49, while 39.8% (43) of the respondent had poor performance with a CGPA between 2.50-3.49 and 1.9% (2) of the respondent having a very poor performance with CGPA between 1.59-2.49. This shows that about 50% of the respondents had a poor academic performance.

The forms in which the factors of academic achievement exert their influence on student nurses are presented in line with the research questions.

4.3.2. Socio-demographic Variables

What are the socio-demographic variables which influence the academic achievement of Nursing Science students?

Figure 3. Percentage Distribution of Socio-demographic Characteristic Influencing Academic Achievement.

Figure 3. Shows that socio-demographic characteristic in the form of marital status 74.1% (80) and age 63% (68) were perceived by the respondent to influence the academic achievement of nursing science student. Gender which has 43.5% (47) and ethnic group with 17.8% (19) had the least influence in that order.

4.3.3. Socioeconomic Variables

What are the socioeconomic variables that influence the academic achievement of Nursing Science Students?

Table 3. Percentage distribution of socioeconomic variables influencing Academic achievement.

SES Variables	Frequency	Percentage
Parental income	90	83.3
Educational level of parent	72	66.7
Family size/structure	46	42.6
Parent's occupation	57	52.7

The data in Table 3 shows that the respondent are influenced by socioeconomic variables in the form of parental income 83.3% (90), educational level of parent 66.7% (72), and parent's occupation 52.7% (57) while family size/structure has least influence on the academic achievement of nursing science student with 42.6% (51).

4.3.4. Environmental Variables

What are the variables in the environment that influence the academic achievement of Nursing Science student?

Table 4. Showing the percentage distribution of environment factors influencing academic achievement.

Environmental Variables	Frequency	Percentage
School location	73	67.6
School structure	51	47.2
School type	21	19.4
School basic amenities	86	79.6
Home environment	28	25.9

The data in the Table 4 shows that only two environmental variables significantly influence the academic achievement of Nursing Science Student. Specifically, school location 67.6% (73) and school basic amenities 79.6% (86). The other variables which include school structures 47.2% (51), home environment 25.9% (28) and school type 19.4% (21), were considered to have less significant in their influence on academic achievement in that order.

4.3.5. Psychological Variables

What are the psychological variables that influence the academic achievement of Nursing Science students?

Figures 4. A bar chart showing the percentage distribution of psychological variables that influence academic achievement.

Data presented in figure 4, reveals that two variables, stress 82.4% (89) and Academic motivation 50% (54) were identified as psychological variable influencing academic performance. Other variables include; satisfaction of basic

needs 45.4% (49), social relationship 37% (40), peer influence/role model 34.3% (37) and role conflict 26 % (28).

4.3.6. Past Academic Achievement

What is the influence of past academic records on the academic achievement of Nursing Science Student?

Table 5. Percentage distribution of responses on the influence of past academic records on academic achievement.

Responses	Frequency	Percentage
Yes	72	66.7
No	36	33.3
Total	108	100

66.7% (72) of the respondents as shown in table 5 believes that past academic records influence present and future academic achievement while 33.3% (36) of the respondent believes to the contrary.

4.3.7. Study Skills

What are the study skills that influence the academic

achievement of Nursing Science Students?

Table 6. Percentage distribution of study skill variables that influence academic achievement.

Study Skills	Frequency	Percentage
Learning approach	73	67.6
Attendance to lecturers	71	65.7
Time management	82	75.9
Group discussion	70	64.8
Clinical experience	63	58.3

The data in Table 6 shows that at least 63% of the respondents believe learning approach, attendance to lectures, time management, discussion groups and clinical/lab experience influence academic performance. With time management 75.9% (82) being the most significant variable.

4.3.8. Research Hypothesis

Ho: parental socioeconomic status does not significantly affect the academic achievement of nursing science student.

Table 7. Hypothetical Responses on Socioeconomic Status of Parent and Academic Performance.

S/N	STATEMENT	SA	A	D	SD	X ² Cal
1	Parental income of student nurses influence the level of their academic achievement in terms of satisfaction of basic need	47	48	7	6	71.78
2.	Educational level of parents affects the students' performance due to the varying of parental involvement in their child academics.	23	49	27	9	
3.	Student nurses from families with small size/structure perform better due to the level of parental attention given to their academics.	12	34	44	18	
4.	The parent's occupations which affect their status in the society affect the academic performance of the student nurse.	18	33	36	21	
Chi-Square Tests						
		Value	Df	Critical value	Tabulated	
	Pearson Chi-Square	71.78	9	0.05	16.91	
	Number of valid cases	432				

Finding: The result of the analysis in Table 7 showed that the chi square calculated (71.8) is greater than the chi square tabulated (16.91) at 0.05 alpha level. Hence the null hypothesis was rejected and the alternative hypothesis accepted which state that parent's socioeconomic status significantly affects the academic achievement of Nursing Science Student.

5. Discussion of Major Findings

5.1. Academic Performance

Findings from data analyzed in response to research question 1 which sought to determine the academic performance of student nurses showed that, about 50% of the respondents had poor academic performance. This level of academic performance can be improved or raised if the variables that influence these students are identified and the positive alternative factors harnessed to enhance their academic achievement.

Based on this finding, the students identified variables perceived as being influential to academic achievement as

follows:

5.2. Socio-Demographic Variables

The finding of the data analyzed in relation to socio-demographic variables as shown in figure 3, showed that marital status and age are the major socio-demographic variable which influences academic performance supported the work in reference [15]. The poor influence of gender and ethnic group as a socio-demographic variable that influence the academic achievement congruent with the work in [11], [15], but contrary to the findings in [18], a significant gender differences were discovered in favour of the females. Marital status and increasing age comes with strain and responsibilities which could affect academic performance positively or negatively. Student nurses that are single tend to be less distracted by family responsibilities and child care compared to married student nurses. While increase in age can be said to increase understanding of concepts, it can also bring out decline in gasping of concept. A person's gender and ethnic group as perceived by the respondent has no bearing in their academic performance.

5.3. Socioeconomic Variables

Findings from the data analyzed in response to research question 3, as shown in Table 3, reveals that student nurses perceive socioeconomic status in the form of parental income, occupation and educational level of parent to have more significant influence on academic performance compared with Family size/structure. This finding is consistent with the work in [5], [10], [11], in which socioeconomic status had significant influence on academic achievement. However, contrary to the finding in this study, the studies in [5] indicate that family size had significant effect while in [9] educational level of parents had no significant influence on academic performance of student nurses.

In lieu of the above, meeting the basic needs of students, dependent on their parents is essential to academic performance, in line with the Maslow's theory of motivation/needs.

5.4. Environment Variables

Table 4 depicted basic amenities and school location as major variables in the environment that affect academic performance. Other variables such as structures, school type and home environment were perceived to be of low significance. This finding supported the work in [11], [12], in which a significant relationship was found between learning environment/location and academic performance, but contrary to the studies in [8], environment had a low significant effect among other factors on academic achievement.

This finding brought to light the need to provide the needed basic amenities, as well as modify the school environment from its location to create a safe and an enabling environment conducive for learning and high academic achievement. As shown from the theoretical framework in Abraham Maslow's hierarchy of needs, students need to feel safe and secure in their environment, because when these basic needs are met, individuals (student nurse) can focus on higher level needs of intellectual achievement in which the urge or motivation to learn increases.

5.5. Psychological Variables

Academic motivation and stress were perceived to be the major variables of psychological factor, to exert significant influence on academic achievement, as shown in figure 4. Other variables include; social relationships, role conflict, peer influence/role model and sleep. This finding concurred with the finding in [5] and [9] that highly motivated nursing science students are significantly better in their academic performance than their less motivated counterpart.

Nursing science students are at the centre of expressing stress as shown in figure 4, with 82%. However, while stress can undermine and reduce the efficiency of the student nurse, motivation is also the driving force that can catapult them to high academic achievement. An integrated learning system juxtaposed in a way that will reduce stress is encouraged in the study.

5.6. Past Academic Records

Table 5 shows that majority of the respondent (66.7%) believes that past academic records evidenced by their previous grade point average has significant influence on academic performance.

Studies as in reference [18] revealed that, achievement motivation and self-concept which could be a product of previous academic records are significantly related to academic achievement. A good and poor academic performance can be a good stimulate to motivate academic achievement.

5.7. Study Skills

Findings from the data analyzed in response to research question 7, which seeks to determine the study skills that influence the academic achievement of Nursing Science Student as shown in table 6; reveal that, time management, learning approaches, attitude towards learning, attendances to lectures, group discussion and clinical experience to be important.

This finding was in agreement with the findings in [12], in which a significant relationship between student learning approach/attitude and their academic achievement was found.

It is important to note, that the identified variables do not act in isolation but interact to exert a certain degree of influence on academic achievement. This interaction may be positive or negative, depending on the degree of academic motivation for high academic performance.

5.8. Research Hypothesis

Finding: After the analysis, the test of hypothesis shows that the null hypothesis was rejected and the alternative accepted that, parental socioeconomic status significantly affects the academic achievement student nurses. The result differs from the finding in [9] in which parental socioeconomic status does not significantly influence academic achievement of nursing science students. However, the finding of this study is line with the finding in [8] and [11] in which a significant relationship between social-economic status of parent and academic achievement of students was found.

In a more common sense assessment, self-supporting students are likely to miss class due to work, the pressure of putting food on the table and the payment of tuition fees. The fact remains however that classroom attendance is necessary for a better understanding of their knowledge and its application. In some schools class attendance is compulsory and has a bearing on the grades of the students. Given the above mentioned assumptions, the self-supporting student therefore gets lower grades than their classmates who belong to the higher socio-economic status.

Positive parental attitude towards their children such as high interest in their children's academic efforts and their knowledge of the importance of good academic performance can bring about good performance. Students with rich parents have certain needs; physical and psychologically, which when met, contribute positively to their academic performance [11]. These needs, which may include

conducive reading atmosphere, good food, provision of books and other materials and so on help to promote effective learning and good performance in schools.

Therefore, socioeconomic status and its variables play a considerable role in the academic achievement of nursing science student.

6. Implication of Study

The result of this study has far reaching implication for nursing education and the general public. Attrition of student nurses due to poor academic achievement as a consequence of various negating factors, can lead to shortage of man power and inefficient delivery of health care services due. And if student nurses that are incompetent are graduated, it will be tantamount to endangering the life of the client/public and denting the image of the profession.

The professional bodies, stakeholders and policy-makers, administrators and teachers, charged with the responsibility of maintaining/improving the professional standard in both nursing education and practice are to examine and understand the various factors that influence the academic achievement of nursing science student and give each institution, school, group, or student, a unique consideration, especially during accreditation and policy making in areas such as curriculum planning to reduce stress, ensuring availability of learning resources and adequacy of learning environment and so on, leading to a focused and goal oriented interventions/recommendation.

To the student Nurse, knowledge is power; self-awareness of the variables that influence one's academic performance is first step towards developing an effective coping strategy or exploiting the available resource to enhance ones academic achievement.

The parents are not left out, because in view of the poor economic state of our nation, and considering the high cost of education, poor academic achievement is the least any parent will expect, therefore parents should understand their part and the role they play as an agent of academic achievement motivation irrespective of socioeconomic status.

7. Conclusion and Recommendation

They key to improving, maintaining and ensuring a continual delivery of efficient and effective health care system partly depends in the training of competent health care professionals of which the majority are nurses. Therefore, the factors which affect the training of these nurses should be of serious concern to all stakeholders in both the educational and professional bodies. Identification and positively harnessing these factors will create a more enabling environment for student nurses, improve the level of academic performance there by ensuring a better provision of health care.

Based on the finding of this study, the following recommendation has been proffered so as to create an atmosphere conducive for high academic achievement;

- I. Balance in curricular and extracurricular activities should be maintained by the students to avoid undue stress.
- II. Programs aimed at positively uplifting the student's academic motivation should be organized intermittently and attendance to workshops encouraged.
- III. The school through partnership with resource persons, NGOs and government can make available basic amenities and provide solid infrastructures to create an enabling environment.
- IV. Work aids and scholarships to deserving students should be encouraged to reduce the effect of socioeconomic variables.
- V. Student's academic performance can be monitored through academic advisers and supervisors who should be in possession of the student nurse's academic records, to foster good learning and study skills as well as encourage group discussions and study groups.
