Abstract: In this paper, the exact solution of Burgers equations are obtained by using coupling homotopy perturbation and Sumudu transform method (HPSTM), theoretical considerations are discussed, to illustrate the capability and reliability some examples are provided, the results reveal that method is very effective and simple.

Keywords: Burgers Equations, Sumudu Transform, Inverse Sumudu Transform, Homotopy Perturbation Method

1. Introduction

The Burger's equation [5] is one of the fundamental equations in fluid mechanics. The burger's equation describes the coupling between diffusion and convection processes.

The standard form of Burgers' equation is given by:

\[ U_t + UU_x = VU_{xx}, \quad t > 0 \]  (1)

Where \( V \) is a constant that defines the kinematic viscosity. If the viscosity, \( V = 0 \), the equation is called In viscous Burgers equation. The in viscous Burgers equation governing gas dynamics. In the viscous Burgers equation has been discussed before as a homogeneous case of the advection problem.

Nonlinear Burger's equation is considered as a simple nonlinear partial differential equations [6] involving both convection and diffusion in fluid dynamics. Burger introduced this equation [5] in order to study the interaction of the opposite effects of convection and diffusion in turbulent fluid in a channel. This equation also describes the structure of shock waves, traffic flow and acoustic transmission. A lot of research has been carried out on Burger's equation.

The Cole-Hopf transformation is the commonly used approach. The solution \( U(x,t) \) was replaced by \( y_x \) in (1) to obtain:

\[ y_{xt} + y_x y_{xx} = Vy_{xxx} \]  (2)

Where by integrating this equation with respect to \( x \) we find;

\[ y_t + \frac{1}{2} y_x^2 = Vy_{xx} \]  (3)

Using the Cole-Hopf transformation;

\[ y = -2V \ln j \]  (4)

so that:

\[ U(x,t) = y_x = -V \frac{y_{xx}}{j} \]  (5)

transforms the nonlinear equation into the heat flow equation;

\[ j_t = Vy_x \]  (6)

It is clear that nonlinear Burger's equation (1) has been converted to an easily solvable linear equation. This wills results to exact solutions depending on the given conditions. Another technique for deriving solutions to nonlinear Burger's equation in terms of parabolic cylinder functions or Airy functions is the method of symmetry reduction. The symmetry reduction method was applied in an altered way where the Burger's equation transformed to an ordinary differential equation.
2. Homotopy Perturbation Sumudu Transform Method (HPSTM)

Sumudu Transform:
In early 90’s, Watugala [1] introduced a new integral transform, named the Sumudu transform and applied it to the solution of ordinary differential equation in control engineering problems. The Sumudu transform is defined over the set of functions:

\[ A = \{ f(t)/\exists M, \tau_1, \tau_2 > 0, |f(t)| < Me^{t/\eta} \} \]

subject to the initial condition, we get;

\[ \mathcal{S}[U(x,t)] = f(x) + uS[U_{xx} - U_{xx}] \]

The inverse of Sumudu transform implies that;

\[ U(x,t) = f(x) + S^{-1}[uS[U_{xx} - U_{xx}]] \]

Now, applying the homotopy perturbation method, we get;

\[ \sum_{n=0}^{\infty} p^n U_n(x,t) = f(x) + p \left( S^{-1} \left[ uS \left( \sum_{n=0}^{\infty} p^n U_n(x,t) \right) \right]_{xx} - \sum_{n=0}^{\infty} p^n H_n(U) \right) \]

Where \( H_n(U) \) are He’s polynomials that represent the nonlinear terms.

The first few components of He’s polynomials, are given by:

\[ H_0(U) = U_0U_{xx} \]
\[ H_1(U) = U_0U_{1x} + U_1U_{ox} \]
\[ H_2(U) = U_0U_{2x} + U_1U_{1x} + U_2U_{ox} \]
\[ H_3(U) = U_0U_{3x} + U_1U_{2x} + U_2U_{1x} + U_3U_{ox} \]

Comparing the coefficients of like powers of \( p \), we get;

\[ p^0 = U_0(x,t) = f(x) \]
\[ p^1 = U_1(x,t) = S^{-1}[uS[U_{0x} - H_0(U)]] \]
\[ p^2 = U_2(x,t) = S^{-1}[uS[U_{1x} - H_1(U)]] \]
\[ p^3 = U_3(x,t) = S^{-1}[uS[U_{2x} - H_2(U)]] \]

Additional components may be computed to increase the accuracy level.

The solution in a series form is as follows. However, the \( n \)-term, approximate \( j_n \) can be determined by:

\[ j_n = \sum_{n=0}^{\infty} p^n U_n(x,t) \]

The following examples will illustrate the discussion carried out above by using the homotopy perturbation method.

3. Applications

In this section, we use homotopy perturbation transform method (HPTM) in solving the Burgers equations.

Example 1: Consider the following Burgers equation;

\[ U_t + UU_x = U_{xx} \]

With the initial condition as;

\[ U(x,0) = x \]

Taking the Sumudu transform of both sides of eq. (15) subject to the initial condition, we get;

\[ \mathcal{S}[U(x,t)] = x + uS[U_{xx} - U_{xx}] \]

The inverse of Sumudu transform implies that;

\[ U(x,t) = x + S^{-1}[uS[U_{xx} - U_{xx}]] \]

Now, applying the homotopy perturbation method, we get;

\[ \sum_{n=0}^{\infty} p^n U_n(x,t) = x + p \left( S^{-1} \left[ uS \left( \sum_{n=0}^{\infty} p^n U_n(x,t) \right) \right]_{xx} - \sum_{n=0}^{\infty} p^n H_n(U) \right) \]

Comparing the coefficients of like powers of \( p \), we get;

\[ p^0 = U_0(x,t) = x \]
\[ p^1 = U_1(x,t) = S^{-1}[uS[U_{0x} - H_0(U)]] \]
\[ p^2 = U_2(x,t) = S^{-1}[uS[U_{1x} - H_1(U)]] \]
\[ p^3 = U_3(x,t) = S^{-1}[uS[U_{2x} - H_2(U)]] \]

And so on. Combining the results obtained for the components, the solution in a series form is given by;

\[ U(x,t) = x(1 - t + t^2 - t^3 + \cdots) \]
Consequently, the exact solution is given by;
\[ U(x,t) = \frac{x}{1 + t}, \quad |t| < 1 \]  \hspace{1cm} (21)

**Example 2:** Let us consider the following Burgers equation;
\[ U_t + UU_x = U_{xx} \]  \hspace{1cm} (22)

With the initial condition as;
\[ U(x,0) = 1 - \frac{2}{x}, \quad x > 0. \]

Taking the Sumudu transform of both sides of eq. (22) subject to the initial condition, we get;
\[ S[U(x,t)] = 1 - \frac{2}{x} + uS[U_{xx} - UU_x] \]  \hspace{1cm} (23)

The inverse of Sumudu transform implies that;
\[ U(x,t) = 1 - \frac{2}{x} + S^{-1}[uS[U_{xx} - UU_x]] \]
\[ \Rightarrow U(x,t) = 1 - \frac{2}{x} + \sum_{n=0}^{\infty} p^nU_n(x,t) \]  \hspace{1cm} (24)

Now, applying the homotopy perturbation method, we get;
\[ \sum_{n=0}^{\infty} p^nU_n(x,t) = 1 - \frac{2}{x} + p\left(S^{-1}\left[uS\left(\sum_{n=0}^{\infty} p^nU_n(x,t)\right)_{xx}\right]\right) - \sum_{n=0}^{\infty} p^nH_n(U) \]  \hspace{1cm} (25)

Comparing the coefficients of like powers of \( p \), we get;
\[ p^0 = U_0(x,t) = 1 - \frac{2}{x} \]
\[ p^1 = U_1(x,t) = S^{-1}[uS(U_{0,xx} - H_0(U))] = -\frac{2}{x^2}t \]
\[ p^2 = U_2(x,t) = S^{-1}[uS(U_{1,xx} - H_1(U))] = -\frac{2}{x^3}t^2 \]
\[ p^3 = U_3(x,t) = S^{-1}[uS(U_{2,xx} - H_2(U))] = -\frac{2}{x^4}t^3 \]

And so on. Combining the results obtained for the components, the solution in a series form is given by;
\[ U(x,t) = 1 - \frac{2}{x} - \frac{2}{x^2}t - \frac{2}{x^3}t^2 - \frac{2}{x^4}t^3 - \cdots \]  \hspace{1cm} (27)

is readily obtained. To determine the exact solution, Eq. (27) can be rewritten as;
\[ U(x,t) = 1 - \frac{2}{x}\left(1 + \frac{t}{x} + \frac{t^2}{x^2} + \frac{t^3}{x^3} + \cdots\right) = 1 - \frac{2}{x-t} \]
\[ \Rightarrow U(x,t) = 1 - \frac{2}{x-t} \]  \hspace{1cm} (28)

**Example 3:** Consider the following Burgers equation;
\[ U_t + UU_x = U_{xx} \]  \hspace{1cm} (29)

With the initial condition as;
\[ U(x,0) = 2\tan x. \]

Taking the Sumudu transform of both sides of eq. (29) subject to the initial condition, we get;
\[ S[U(x,t)] = 2\tan x + uS[U_{xx} - UU_x] \]  \hspace{1cm} (30)

The inverse of Sumudu transform implies that;
\[ U(x,t) = 2\tan x + S^{-1}[uS[U_{xx} - UU_x]] \]  \hspace{1cm} (31)

Now, applying the homotopy perturbation method, we get;
\[ \sum_{n=0}^{\infty} p^nU_n(x,t) = 2\tan x + p\left(S^{-1}\left[uS\left(\sum_{n=0}^{\infty} p^nU_n(x,t)\right)_{xx}\right]\right) - \sum_{n=0}^{\infty} p^nH_n(U) \]  \hspace{1cm} (32)

Comparing the coefficients of like powers of \( p \), we get;
\[ p^0 = U_0(x,t) = 2\tan x \]
\[ p^1 = U_1(x,t) = S^{-1}[uS(U_{0,xx} - H_0(U))] = 0 \]
\[ p^2 = U_2(x,t) = S^{-1}[uS(U_{1,xx} - H_1(U))] = 0 \]
\[ p^3 = U_3(x,t) = S^{-1}[uS(U_{2,xx} - H_2(U))] = 0 \]

Thus, the exact solution is given by;
\[ U(x,t) = 2\tan x \]  \hspace{1cm} (34)

**Example 4:** Consider the following Burgers equation;
\[ U_t + UU_x = U_{xx} \]  \hspace{1cm} (35)

With the initial condition as;
\[ U(0,x) = -\frac{2}{t}, \quad U_x(0,x) = \frac{1}{t} + \frac{2}{t^2}. \]

Applying the Sumudu transform of both sides of eq. (35) subject to the initial condition, we get;
\[ S[U(x,t)] = -\frac{2}{t} + u\left(\frac{1}{t} + \frac{2}{t^2}\right) + u^2S[U_t + UU_x] \]  \hspace{1cm} (36)

The inverse of Sumudu transform implies that;
\[ U(x,t) = -\frac{2}{t} + x\left(\frac{1}{t} + \frac{2}{t^2}\right) + S^{-1}[u^2S[U_t + UU_x]] \]  \hspace{1cm} (37)

Now, applying the homotopy perturbation method, we get;
\[ \sum_{n=0}^{\infty} p^nU_n(x,t) = -\frac{2}{t} + x\left(\frac{1}{t} + \frac{2}{t^2}\right) + p(S^{-1}[u^2S(\sum_{n=0}^{\infty} p^nU_n(x,t)) + \sum_{n=0}^{\infty} p^nH_n(U)]) \]  \hspace{1cm} (38)

Comparing the coefficients of like powers of \( p \), we get;
\[ p^0 = U_0(x,t) = -\frac{2}{t} + x\left(\frac{1}{t} + \frac{2}{t^2}\right) \]
\[ p^1 = U_1(x,t) = S^{-1}[u^2S(U_{0,t} + H_0(U))] = -\frac{2x^2}{t^3} + \frac{2x^3}{3t^4} \]  \hspace{1cm} (39)
P^2 = U_2(x,t) = S^{-1}\left[u^2S[(U_1)_t + H_1(U)]\right] = \frac{4x^2}{3t^4} + \cdots

And so on. Combining the results obtained for the components, the solution in a series form is given by;

\[ U(x,t) = x - \frac{2}{t} \left(1 - \frac{x}{t} + \frac{x^2}{12} - \frac{x^3}{t^3} + \cdots\right) \]  

(40)

Consequently, the exact solution is given by;

\[ U(x,t) = \frac{x}{t} - \frac{2}{x+t} \]  

(41)

4. Conclusions

For solving, and decomposing nonlinear terms in Burgers equation, one can use Adomian polynomial. The Adomian polynomial is simple, but requires tedious calculation. To overcome this, a new approach using He’s polynomial is proposed for solving the Burgers equation. Called homotopy perturbation and Sumudu transform method (HPSTM). The proposed method reduces computational work compared to classical methods. And, also (HPSTM) may be treated as refinement method to existing numerical techniques, and word finds wide applications.
