Abstract: Chemical extract of *Nerium oleander* (NO) is identified as in vitro antibacterial and antifungal activities. However, there is no any study about antiviral effect of NO distillate (NOD). The aim of this study was to evaluate in vitro effects of NOD alone and combined with acyclovir on Parainfluenza-3 (PI-3) virus. Lyophilized NOD was dissolved at concentration of 10 mg/mL with distilled water and filtered. The thiazolyl blue test was used to evaluate the cytotoxic activity of the NOD, and acyclovir. NOD did not cause cytotoxicity against to MDBK cells up to 10 mg/mL concentrations while acyclovir did not cause cytotoxicity up to 0.97 µg/mL. NOD (10 mg/mL), acyclovir (0.97 µg/mL) and NOD + acyclovir were treated with 100 TCID₅₀ diluted PI-3 in 96-well plates. Antiviral activity of NOD was statistically (P<0.05) different from NOD + acyclovir against PI-3. The most effective results obtained from using single of NOD (P<0.05) while acyclovir was not effective (P>0.05). In conclusion, it is referred that NOD has antiviral effect and it can be evaluated in the treatment of PI-3 in future.

Keywords: PI-3, Nerium Oleander, Acyclovir, Antiviral

1. Introduction

Parainfluenza-3 (PI-3) virus causes the economically important infectious respiratory disease in cattle. The virus is an enveloped, single-stranded negative sense nonsegmented RNA virus within the *Respirovirus* genus of the family Paramyxoviridae [1] in the order Mononegavirales. It is considered to be associated with the bovine respiratory disease (BRD) complex, and it can predispose an animal to the development of severe secondary bacterial pneumonia [2, 3]. *Nerium oleander* (NO), a member of the Apocynaceae family, is an ornamental plant and widely exists in the tropic and subtropic regions including Mediterranean region. It is the only species currently classified in the genus *Nerium*. NO has a prolonged flowering period during the dry season [4-7]. NO includes cardiac glycosides [5] and the aqueous extract contains polysaccharides, some cardenolids and triterpenoids [8]. Although plant has toxic agents [9], it is used for anticancer [10, 11], antidepressant [4] and cardioprotective [12] purposes. In addition, chemical extract of NO has antimicrobial and antifungal activities [13, 14] on

the contrary to distillate of NO [15]. Chemical extract of NO has no antiviral activity on the *Autographa Californica Virus* [16], while Rajbhandari et al [17] reported that chemical extract of NO has considerable antiviral activity against herpes simplex virus. Although antimicrobial effects of chemical extracts have been reported [13, 14, 17], it is highly toxic plant for mammals [9, 18], hence usage of chemical extracts of NO is not practical in the medicine. It has been reported that NO distillate (NOD) has beneficial effects in the type 2 diabetic rats [19] and oral administration of NOD has no toxic in the healthy rats [20]. In addition, NOD has no cytotoxicity in the MCF-7 breast cancer cell lines [21]. On the contrary to non-cytotoxic effect of NOD [20], chemical extract of NO has cytotoxic and mutagenic effects [22]. Acyclovir, 9- [(2-hydroxy ethoxy) methyl], guanine is an antiviral drug, synthetic guanosine analogue, and used for treating different viruses such as varicella zoster virus [23] and herpes simplex virus [24] infections.

It has been hypothesized that the antiviral activity of NO [17] distillate without cytotoxic effect and non-toxic in rats [20] and may increase the effect of medical antivirals,

however, chemical extract of NO is cytotoxic, poisonous [9, 25] and cannot be used in medical applications. The purpose of this study was to determine the antiviral activities of NOD, acyclovir, and combined usage on PI-3 virus in Madin Darby Bovine Kidney (MDBK) cell lines in vitro.

2. Material and Methods

2.1. Preparation of *Nerium Oleander*, *Nerium Oleander* Distillate, and Acyclovir

New shoots of NO plant was collected between March and September 2012 from Mediterranean region of Turkey. The plant was identified and authenticated at the Department of Biology, University of Selcuk. Collected plant was washed and shredded. Sufficient distilled water added and the mixture was heated in resistant container. When liquid started to evaporate, vapor was collected to other clean glass containers by cooling of the surface with cold water. Lyophilizator was used to lyophilization of NOD. Lyophilized NO distillates were dissolved at concentrations of 0.02, 0.04, 1, 2, 4, 8, 10, 12, 14, 16 and 20 mg/mL in sterile distilled water [19] and sterilized by filtration (0.22 μ m membrane filter). Acyclovir (Acycloguanosine ≥ 99 HPLC powder, Sigma A4669) was dissolved at concentrations of 500, 250, 125, 62.5, 31.25, 15.62, 7.81, 3.90, 1.95, 0.97, 0.48 μ g/mL in sterile distilled water by sterilizing with filtration (0.22 μ m membrane filter).

2.2. Cell Cultures and Virus

MDBK monolayer cell lines and PI-3 (virus control, VC) used in this study were obtained from Department of Virology, Faculty of Veterinary Medicine, University of Selcuk. The cells were maintained as monolayers in 25 cm² plastic tissue culture flasks (Corning, USA) at 37°C in a humidified atmosphere containing 5% CO₂ in air. Concentrate antibiotics and antifungals (Biological Industries, Israel) were utilized to eliminate the growth of bacteria and fungi. MDBK cell monolayers were grown in sterile Dulbecco's Modified Eagle's Medium (DMEM, Biological Industries, Israel) and 10% heat-inactivated fetal calf serum (FCS, Biological Industries, Israel), 10 mg/mL of streptomycin, 10000 U/mL penicillin, and nystatin 1250 U/mL. The FBS in the medium represents a cocktail of most of the factors required for cell proliferation and maintenance. Exponentially growing cells were used in the experiments.

2.3. Cytotoxicity of NOD and Acyclovir

MDBK cells (250.000/mL) were exposed to eleven different concentrations of NOD (0.02, 0.04, 1, 2, 4, 8, 10, 12, 14, 16 and 20 mg/mL), and acyclovir (500, 250, 125, 62.5, 31.25, 15.62, 7.81, 3.90, 1.95, 0.97, 0.48 μ g/mL). Rates of growth within 120 hours, the inhibitory concentration 50 (IC₅₀) using linear regression analyses and

the index of selectivity of each concentration were determined.

2.4. Virus Titration

Virus titration was performed as began [26] using 96 well micro plate (Corning, USA) with 4 wells per dilution. The virus titer was estimated from cytopathogenicity of cells induced by viral infection and expressed as 50% tissue culture infectious dose/mL (TCID₅₀/mL).

2.5. MTT Assay

The extent of the cell proliferation and cell viability was determined by thiazolyl blue test (MTT, 3-(4, 5-Dimethylthiazol-2-yl)-2, 5-diphenyltetrazolium bromide) assay. MTT assay was employed as a cytotoxicity test. It was performed to study the antiproliferative effect of NOD using as described previously [27]. 100 μ L containing 2×10^5 of cell suspension was placed briefly in each of 96-well micro plates cells incubated at 37°C in 5% CO₂ for 24 h to attach. After attachment the medium was aspirated off carefully and cell cultures were treated with the NOD (50 μ L at concentrations of 0.02, 0.04, 1, 2, 4, 8, 10, 12, 14, 16, and 20 mg/mL), acyclovir (500, 250, 125, 62.5, 31.25, 15.62, 7.81, 3.90, 1.95, 0.97, 0.48 μ g/mL) for 24 h. The cell control contained the cell culture medium only. At the end of treatment media were removed from the wells and 20 μ g of MTT (Cell proliferation Kit I, Germany) containing DMEM was added to each well. Cells were than incubated at 37°C for 4 h in a CO₂ incubator (Thermo Scientific, USA). Spectrophotometric absorbance of the purple blue formazan dye was measured using an ELISA reader (Rayto RT-2100C, China) at 540 nm. Optical density (OD) of each sample was compared with control OD. At least two independent experiments were performed.

2.6. Antiviral Activity of NOD, Acyclovir and NOD + Acyclovir

Dilutions of NOD (10 mg/mL), acyclovir (0.97 μ g/mL), and NOD + acyclovir were incubated with MDBK cells in 96 wells micro plates for 24h at 37°C in 5% CO₂ atmosphere. After removal of the compound the cells were washed three times with sterile PBS (Sigma, USA) and seeded with 100 TCID₅₀/0.1 mL of PI-3. Other wells were evaluated to cell control (CC), and virus control (VC). After treatments 50 μ L MDBK cells (3×10^5 /mL) in DMEM supplemented with 10% FBS were seeded into well of 96-well plates and cultured for 72 h at 37°C. All wells were observed for cytopathogenic effect (CPE) under inverted microscope on a daily basis.

2.7. Statistical Analysis

The OD absorbance values were compared by ANOVA and Duncan test as posthoc (SPSS 19.0). Data are presented as mean $\pm$ SEM. P<0.05 level was accepted as statistically significance level.

3. Results

3.1. Cytotoxicity of NOD and Acyclovir

Higher concentrations than 10 mg/mL of NOD and 0.97 µg/mL acyclovir had cytotoxic effects on MDBK cells. As a result 10 mg/mL concentration of NOD and 0.97 µg/mL acyclovir were used in the antiviral assays. No CPE was observed in NOD control, acyclovir control, and CC in MDBK cell lines after 24th, 48th and 72th hours; however CPE was identified in all of VC wells.

3.2. Antiviral activities of NOD, Acyclovir, and NOD + Acyclovir

OD of experiment groups are shown in Table 1. NOD showed more significant ($P<0.05$) antiviral activity than acyclovir against PI-3 in vitro. Infected MDBK cells treated with NOD (10 mg/mL) and NOD + acyclovir did not show any detectable CPE when compared to VC wells. In addition, acyclovir (0.97 µg/mL) had lower antiviral effect against PI-3 in MDBK cells.

Table 1. OD Results of experiment groups.

	N	Mean±SEM
Cell control	8	1.302±0.0787 ^a
Virus control	8	0.699±0.0452 ^d
Nerium oleander distillate	16	1.062±0.0490 ^b
Acyclovir	16	0.815±0.0236 ^{cd}
NOD +Acyclovir	16	0.900±0.0541 ^c

a, b, c, d: values marked with different letters in the same line are statistically significant ($P<0.05$, Duncan test).

4. Discussion

Nerium oleander widely present in the Mediterranean region. Although some beneficial effects including anticancer [10, 11] activities of NO extracts have been reported, its highly toxic effects [9, 18] restrict in the clinical usage. However, distillate of NO has no toxic effect in the rats [19, 20] and has no cytotoxicity [21].

In the current research, NOD had notably ($P<0.05$) antiviral activity against to PI-3, whereas acyclovir less ($P>0.05$) antiviral activity (Table 1). Although many research exits its antibacterial and antifungal activities [13-15], there are very limited data that antiviral effect of NO [16, 17]. It has been reported that extract of NO has antiviral activity against herpes simplex virus [17], while it has no antiviral activity on the *Autographa Californica nuclear polyhedrosis virus* [16]. These results may indicate that extract and distillate of plants show different effect of the virus. In the present study, acyclovir had less ($P>0.05$) antiviral activity, whereas NOD + acyclovir combination had more ($P<0.05$) antiviral activity against to PI-3 (Table 1). Usage of acyclovir is not accepted as basic drug in the treatment of PI-3 caused infections [28]. Antiviral activity of NOD + acyclovir may be depend on directly NOD in this study.

In the current research, NOD caused cytotoxicity effect at higher concentrations than 10 µg/mL level. There is lack of literature information about the effects of NO extracts and distillate on cells, in vitro. NO has cytotoxic and anticancer activities [25, 29, 30] and studies explain the relation between cytotoxic/anticancer effects and Pgp [11]. In other studies, NO extract caused cytotoxicity and mutagenicity [22] and NO leaves caused cardiomyocytes degeneration, renal necrosis in goats [31] and death in cattle [9]. On the contrary to these studies, oral administration of NOD has no cytotoxic effect in rats [20] and NOD has no cytotoxic effects on MCF-7 breast cancer cell lines [21]. These results indicate that NOD can be toxic only at higher concentrations in mammals, and distillate of NO is more safely than extracts.

In conclusion, NOD may be used as an antiviral against to PI-3 but further studies of the antiviral activity of NOD associated with the different virus types are necessary about in vitro effects of NOD. However, NOD should test different methods and may provide useful comparative information in the future.
