Abstract: A cross sectional study was conducted in and around Mekelle, Tigray, Ethiopia from November 2013 to May 2014 with the aims to assess reproductive performance and prevalence of reproductive problems in crossbred (Holstein Friesian x Zebu) dairy cattle. A questionnaire survey methodology was used. The study sampled 177 randomly selected dairy farms comprising 1013 crossbred dairy cattle (736 cows and 277 heifers). The mean age at first service, age at first calving, first postpartum estrus and calving interval were 24.8 months, 35.3 months, 114.5 days and 401.5 days, respectively. Prevalence rates of reproductive problems recorded in the study area were anestrus (37.8%), repeat-breeding (21.0%), dystocia (11.6%), retained fetal membranes (11.5%), endometritis (6.6%), abortion (6.4%), prolapsed uterus/vagina (2.9%), stillbirth (2.0%) and freemartin (0.2%). Incidence of abortion did not vary with parity and stages of gestation. Breeding and the possible causes of missing insemination/mating while animals were in estrus are problematic. In conclusion, this study has revealed that the reproductive performance of crossbred dairy cattle was not optimal, and anestrus, repeat-breeding, dystocia, retained fetal membranes, endometritis and abortion were the major reproductive problems. More effective breeding and reproductive health management should be considered to improve the fertility of this crossbred cattle herd. Awareness and training should be provided to the farming community to improve the productivity in the region.

Keywords: Crossbred Dairy Cattle, Reproductive Performance, Reproductive Problems

1. Introduction

Ethiopia owns the largest livestock population in Africa and one of the largest in the world, having 52 million cattle, 33 million sheep, 30 million goats, 2.5 million camels and 38 million poultry [1]. About 85% of the Ethiopian population are engaged in the agricultural sector, which is the backbone of the country’s economy, with livestock and its products being important sources of food and income [2]. However, dairying has not been fully exploited and promoted. Cattle play the most important role in the farming economy followed by sheep and goats. This cattle population is primarily of indigenous Zebu type [3]. Barka, Fogera, Boran, Horro, Sheko, Afar and Arsi are also among the Ethiopian local breed cattle which are crossbred with exotic breeds (Holstein Friesian and Jersey). Cattle are well adapted and distributed among diverse ecological conditions and management systems [4].

Dairy cattle production in the country is classified into four major livestock production systems: rural smallholder (mixed crop-livestock) production, pastoral and agro-pastoral production, urban and peri-urban smallholder dairy production, and specialized commercial dairy production systems [2,5]. Infertility is the main problem that affects production in both local and crossbred cows and heifers in Ethiopia [6,7,8]. Consequently, the economic gain for example, calf crops, milk and milk products, from these cows is not satisfactory. Puberty in heifers is usually at 24 months in Zebu X Holstein-Friesian crossbred dairy cattle [7] and,
heifers are reported to have an extended later age at first calving. Most cows in smallholder farms do not optimally calve every 12 to 13 months after the first calving [6].

Tigray regional state (northern part of Ethiopia) contributes a significant proportion (3.5 million) to the Ethiopian cattle population [1]. There is also an increased demand for milk and milk products in and around Mekelle city [9], due to increased population growth and urbanization. Consequently, the number of people involved in small scale intensive, large scale intensive and small holder dairy farming has increased dramatically in the vicinity of the city. This growth effort is supported by government extension programs through provision of door-to-door Artificial Insemination (AI) service to improve the genetic potential and increase milk production. Despite the effort by government to enhance the dairy sector, there is limited ongoing livestock research, particularly on assessment of reproductive and productive performance and reproductive problems of dairy cattle. Therefore, the objectives of this study were to assess reproductive performance and to study the prevalence of reproductive problems of crossbred (Zebu x Holstein Friesian) dairy cattle in and around Mekelle, Tigray, Ethiopia.

2. Materials and Methods

2.1. Study Area

The study was conducted from November 2013 to May 2014 in and around Mekelle city, which is the largest city in northern Ethiopia, and the capital city of Tigray. It is located at 39° 29’E and 13° 30’ N at an altitude of 2000 metres above sea level. The climate of the study area conforms to that of Ethiopian Highlands. The mean annual rainfall is 619mm, which is bimodal with short rainy seasons occurring from March to May and from mid-September to February. The annual minimum and maximum temperature is 11.8°C and 29.9°C, respectively [10].

2.2. Study Methodology

2.2.1. Study Farms and Animals

The number of farms sampled in the study was determined by N=0.25/SE², where N= number of sampled farms, SE=Standard error [11]. A list of 210 farms housing crossbred dairy animals were considered as the sampling frame. From this, 173 farms were selected using systematic random sampling. Considering standard error of 0.038 with 95% confidence interval as follows, N=0.25/ (0.038)² = 173. In total, 177 dairy farms were included in the survey to enhance precision. These farms housed 736 crossbred (Zebu x Holstein Friesian) dairy cows and 277 crossbred dairy heifers aged two years or above. They also housed 55 crossbred dairy bulls and 398 crossbred dairy calves during the study period.

2.2.2. Questionnaire Data Collection and Analysis

The questionnaire (Appendix 1) was translated into local language (Tigrigna) and piloted beforehand. A cross-sectional survey was used to collect information on reproductive performance and assess the common reproductive problems of crossbred dairy cows and heifers. Farm owners, attendants, managers, and veterinary professionals were given a short briefing about the overall aims of the study. They were asked to complete the questionnaire survey information regarding age at first service, age at first calving, calving interval, first post-partum estrus, reproductive health problems, breeding history (AI, natural mating, parity) and other related questions including the year of farm establishment. Data was analysed using two tailed Fisher's exact test where a p value of < 0.05 was considered significant [12].

3. Results

3.1. Reproductive Performance

The average ages at first service and at first calving were 24.8 months (range 10 to 48 months) and 35.3 months (range of 21 to 57 months), respectively. First postpartum estrus and calving interval are indicated in Table 1.

3.2. Common Reproductive Problems

Anestrus, repeat-breeding, dystocia, retained fetal membranes (RFM), endometritis and abortion were the major reproductive problems cited by farmers/attendants or veterinarians in crossbred dairy cattle, with prevalence indicated in Table 2. Among 177 farms, 163 (92.1%) farms were affected by one or multiple reproductive problems. There were similar incidences of abortion in cows and heifers based on stages of pregnancy (Table 3). Overall incidence of abortion in crossbred cattle in first, second and third trimesters were, 17.5%, 42.1% and 40.4%, respectively. There was significantly higher (p<0.05) incidence of anestrus in heifers than cows. Conversely, higher incidence (P<0.05) of dystocia and retained placenta was recorded in multiparous than in primiparous cattle (Table 2).

The common breeding method in the study area is mixed AI and natural mating by bull (Table 4). Among 177 farms, 68 (38.4%) farms had shown missing insemination/mating due to various factors. Although animals showed typical signs of estrus (including clear vaginal discharge, restlessness, mounting other cows, mounted by other cows), owners failed to get their animals mated or inseminated. Major causes of missed insemination recorded are absence of AI technicians when called to inseminate, or arriving very late (33.8%), poor animal condition (19.1%), inattentiveness (11.8%) and reproductive/other health problems (8.8%).

...
4.1.1. Age at First Service and Age at First Calving

In the current study, the age at first service and calving were in accordance with previous studies in small holder dairy farms in Oromia region, Ethiopia [8]. Similar ages were also recorded in crossbred cattle at first service in Gondar town [13] and in Dire Dawa [14], Ethiopia. Ages at first service and first calving were similar to recent studies in small scale farms in and around Mekelle, Ethiopia [19,20]. The current study showed comparatively earlier age at crossbred dairy heifers at first calving than in Zimbabwe [21], other parts of Ethiopia [6] and in Malawi [22]. Heifers can be bred when they attain 60% of their adult body weight [23]. For a dairy farm to be profitable there should be a focus on heifer’s timely growth and conception. Age at puberty and calving are highly related to body weight of the heifers [24].

4.2. Prevalence of Reproductive Problems

Anestrus* and repeat-breeding* were compared between multiparous cows and heifers; whereas, dystocia, retained fetal membranes (RFM), endometritis, abortion, stillbirth and prolapsed uterus/vagina were compared between multiparous cows and primiparous heifers; freemartin associated with heifers. Animals were reported to have one or multiple exposures to a single or to multiple problems. *Values in parentheses are percentages. P-value of < 0.05 considered significant.

4.4.1.2. First Postpartum Estrus and Calving Interval

Comparatively longer postpartum estrus was recorded in the present study than in Oromia region, Ethiopia [8]. In contrast, the present study showed shorter postpartum estrus period compared to studies in Abernosa Ranch [25] and in small scale farms in and around Mekelle, Ethiopia [15]. In the present study, the calving interval was similar to previous reports [8,19]. In contrast, the present findings revealed shorter calving intervals compared to previous studies in central part of Ethiopia [6], Abernosa Ranch, Ethiopia [17], small scale dairy farms in and around Mekelle, Ethiopia [15], Malawi [22] and Tanzania [18]. Unlike the present study and other reports in crossbred (Zebu x Holstein Friesian) dairy cattle, pure Zebu (Bos indicus) cattle have a much longer calving interval [26]. Farmers/attendants or farm managers in the present study were asked if they had observed pregnancy overdue. They responded indicating animals bearing male calves tend to have 1 to 2 weeks longer gestation periods compared to female calves, which is in accordance with previous reports [8].

4.4.2. Prevalence of Reproductive Problems

Anestrus was found to be the most prevalent reproductive problem followed by repeat-breeding. This is in contrast to a previous questionnaire survey [27]. The present study also demonstrated high incidence of anestrus in comparison with a study in crossbred cattle in Bangladesh [28]. Our study indicates that repeat-breeding was a major problem affecting...

Pre-screening questionnaire given to livestock owners/ farm managers to study the prevalence of reproductive diseases/ problems in crossbred cows/heifers in and around Mekelle, Tigray, Ethiopia.

1. Name of the farm or farm owner

2. Address of the farm: ________________________________ ; phone no. __________________

3. When was the farm established?  □ 1-5 years  □ 6-10 years  □ > 10 years
4. Type of farm: □ Intensive □ Semi-intensive □ Extensive
5. Number of cattle in the farm (owned)? ___________________________
a. No. of Cows__________  c. No. of bulls__________b. No. of heifers__________d. No. of calves__________
6. Types of feed cows or heifers are fed:
   □ Hay □ Straw □ Concentrate □ Concentrate and hay or straw
7. How many times do animals get feed per day? __________________________
8. Do animals get water regularly? ______; how many times a day? ________________
9. Age of cows and/or heifers and parity (years):
   Cow 1. _______ (parity______); heifer 1. _______
   Cow 2. _______ (parity______); heifer 2. _______
   Cow 3. _______ (parity______); heifer 3. _______
   Cow 4. _______ (parity______); heifer 4. _______
   Cow 5. _______ (parity______); heifer 5. _______
   Cow 6. _______ (parity______); heifer 6. _______
   Cow 7. _______ (parity______); heifer 7. _______
   Cow 8. _______ (parity______); heifer 8. _______
   Cow 9. _______ (parity______); heifer 9. _______
   Cow 10. _______ (parity______); heifer 10 _______
10. What is the number of pregnant cows/heifers in the farm?
   A) Cows: _______ (trimester: _____ 1st; _____ 2nd; _____ 3rd)
   B) Heifers: _______ (trimester: _____ 1st; _____ 2nd; _____ 3rd)
11. Method of insemination? Natural AI Both
12. Number of animals in estrous now? A) Cows: _______; B) Heifers: _______
13. How many lactating cows do you have? _______
14. What is the number of anestrus animals in the farm? A) Cows? _____; B) Heifers: _____
15. Were any of your cattle encountered reproductive diseases or problems in the past?  □ Yes □ No
16. If yes, what reproductive diseases or problems were observed? _______________________________________
17. Did any of your cows suffer from abortion?  □ Yes □ No
18. If yes, what month of the pregnancy abortion was occurred?
   a. before 3 months   c. over 6 months
   b. 3 to 6 months     d. a, b and c
19. Did any of your cows encounter pregnancy overdue in the past? □ Yes □ No
   If yes, how many months was the cow pregnant before it was given veterinary assistance?
   ______________________? Number of cows diagnosed positive? __________
20. Did any of your cows or heifers give birth to a dead calf at a normal gestation length (9 months) in the past?
    □ Yes □ No
If yes, how many cows? __________

21. Did any of your cows suffer from dystocia in the past? Yes  No
If yes, how many of your cows suffered from dystocia? ________

22. Did any of your cows suffer from endometritis in the past? Yes  No
If yes, no of cows or heifers suffered from endometritis? __________

23. Did any of your cows or heifers suffer from vaginal, cervical or uterine prolapse in the past? Yes  No
If yes, number of cows or heifers with vaginal prolapse? __________ ; Cervical prolapse? __________ or uterine prolapse? __________

24. Did any of your animals encounter retained fetal membranes in the past? __________
How did you solve the problem?

25. Have any of your cows or heifers been repeater (repeat breeder)?
If yes, what do you think the cause/s for the animal to come back in to estrus again?
What measure did/do you take to get the animal pregnant?

26. Did any of your cows suffer from metritis in the past?
If yes, what treatment did the cow get?
What was the effect of the treatment in the reproductive status of the cow after that?

27. Did any of your animals come to estrus, but missed insemination or mating in the past? Yes  No
If yes, why was the animal not inseminated or mated?
a. Lack of bull
b. Lack of AI technician
c. Lack of means of communication to AI technician
d. Called AI technician, but did not come to inseminate or did come very late
e. Reproductive tract problem
f. Size of the animal was very small to breed
g. Lack of nutrition
h. All or some of the above causes

28. Did any of your animals suffer from any health problem other than reproductive health?
If yes, please describe the disease and signs the animals showed.

29. What is your future plan to improve the reproductive performance of your animals?

30. What do you think the government (agriculture, universities, etc.) and private sectors should do to support improve fertility of your animals? ______________

31. Do you have any comment?

Thanks!!
