Abstract: Different Pyrazoline derivatives were synthesized by cyclization of substituted chalcone derivatives in presence of hydrazine hydrate. A series of novel 1,3,5-triaryl pyrazoline derivatives has been synthesized by the reaction of chalcone and phenylhydrazine in the presence of Silica-supported Preyssler Nanoparticles, $H_{14}[NaP_5W_{30}O_{110}]/SiO_2$, Preyssler $H_{14}[NaP_5W_{30}O_{110}]$ and Keggin heteropolyacids, $H_3PW_{12}O_{40}$, $H_7[PMo_8V_4O_{40}]$, $H_6[PMo_9V_3O_{40}]$, $H_5[PMo_{10}V_2O_{40}]$, $H_4[PMo_{11}VO_{40}]$, $H_3[PMo_{12}O_{40}]$ as catalyst under aqueous conditions is described. The best conditions were observed using Preyssler and Silica-supported Preyssler Nanoparticles as catalysts. The catalyst is recyclable and reusable. The structures of compounds obtained were determined by IR and $^1$H NMR spectra.

Keywords: Pyrazoline, Nanoparticles, Preyssler, Heteropolyacids, Catalyst, Synthesis

1. Introduction

Heterocyclic compounds have gained much importance in medicinal chemistry due to its presence in large number of pharmacologically active moieties. Among the five membered heterocyclic containing two hetero atoms in its ring structure, pyrazole is one of the most important one as a large variety of biological activities have been reported for various pyrazole derivatives. Pyrazolines are well known, and important nitrogen-containing five-membered heterocyclic compounds and the pyrazoline ring protons were bonded with carbon atoms on a spatially different environment [1]. Pyrazolines are widely used and studied privileged pharmacophores in medicinal chemistry due to their synthetic and biological importance. Some studies have confirmed that pyrazoline derivatives possess antimicrobial activity and they have found to possess anti-fungal, anti-depressant, anti-convulsant, anti-inflammatory, anti-bacterial, anti-cancer, antioxidant, anti- pyretic, anti-neoplastic activities, anti-viral, anti-amoebic, acaricidal agro chemical fungicides or insecticides, anti-cholinergic, anti-diabetic, anti-HIV, antimalarial, anxiolytic, antiparasitic, anti-allergic, anti-microbial, anti-tuberculosis, tyrosinase inhibitor, hypoglycemic, hypotensive, immuno suppressive, anti-tumor [2-7]. Conventional method of synthesis of pyrazolines involves the base-catalyzed condensation of aromatic ketones to give α, β-unsaturated ketones (also called as chalcones), which undergo subsequent cyclization with hydrazine and hydrazine derivatives yielding 2-pyrazoline and 2-pyrazoline derivatives. In this method, hydrazones are formed as intermediates that can subsequently cyclized to 2-pyrazolines in presence of a suitable catalyst such as NaOH [8] or acetic acid [9]. The α,β-unsaturated ketones can play the role of versatile precursors in the synthesis of the corresponding pyrazolines [10-15]. Numerous methods have been reported for the preparation of pyrazoline compounds. Fischer and Knoevenagel in the nineteenth century studied the reaction of α,β-unsaturated aldehydes and ketones with phenyl hydrazine in acetic acid by refluxing, which became one of the most
The synthesis of Preyssler-type nanocatalysts has been largely studied due to their high catalytic activity and improved selectivity [19]. Heteropolyacids as solid acid catalysts are green with respect to corrosiveness, safety, quantity of waste and separability and it is well known that the use of heteropolyacid catalysts for organic synthesis reactions can give a lot of benefits. One of the unique features that make solid heteropoly acids economically and environmentally attractive is their stability and bronsted acidity. The catalytic function of heteropolyacids (HPAs) and related polyoxometalate compounds has attracted much attention, particularly in the last two decades [20]. These compounds exhibit high activity in acid-base type catalytic reactions, hence they are used in many catalytic areas as homogeneous and heterogeneous catalysts. The application of Preyssler catalysts is highly limited and only a few examples of catalytic activity have been reported [21]. The important advantages of this heteropolyacid are: strong Bronsted acidity with 14 acidic protons, high thermal stability, high hydrolytic stability (pH 0–12), reusability, safety, quantity of waste, ease of separation, corrosiveness, high oxidation potential, and application as a green reagent along with an exclusive structure. Over the last decade, due to the unique properties of nanoparticles along with their novel properties and potential applications in different fields [22], the synthesis and characterization of catalysts with lower dimension has become an active topic of research. As the particle size decreases, the relative number of surface atoms increases, and thus activity increases. Moreover, due to quantum size effects, nanometre-sized particles may exhibit unique properties for a wide range of applications [23]. In spite of extensive investigations on Keggin-type nanocatalysts [24], the synthesis of Preyssler-type nanocatalysts has been largely overlooked. Recently we have explored the application of a Preyssler catalyst in various organic reactions.

2. Experimental

2.1. Chemicals and Apparatus

Melting points were determined by Thieles tube method (Table 1) and were uncorrected. 1H-NMR spectra were recorded on a Bruker AM 300 MHz and 13C NMR (Bruker Gemini 100 MHz) spectrometer using CDCl3 as a solvent and tetramethylsilane as an internal standard. The chemical shifts are expressed in δ (ppm). FT-IR spectrometer of Perkin Elmer was used for study. Thin layer chromatography (TLC) was done with pre-coated silica gel plates (GF254 Merck) using benzene:ethyl acetate (9:5:0.5, v/v) as the mobile phase.

2.2. Catalyst Synthesis Procedure

2.2.1. Synthesis of SiO2 Nanoparticles

The materials used in this work include tetraethyl orthosilicate (TEOS) (Merck, 98%) as the SiO2 precursor. Besides the main precursor, nitric acid (65%) and double distilled water were used for peptization and solvent, respectively. The sol-gel precursor solution was obtained by mixing tetraethyl orthosilicate (TEOS) and ethanol with specific molar ratios of ethanol to TEOS. The mixture was stirred using magnetic stirring.

2.2.2. Preyssler Heteropolyacid Catalyst Preparation

Preyssler catalyst, H14[NaP2W9O34] was prepared by passage of a solution of the potassium salt (30 mL) in water (30 mL) through a column (50 cm × 1 cm) of Dowex 50w×8 in the H+ form. The eluent was evaporated to dryness under vacuum [25, 26].

2.2.3. Synthesis Procedure of Nanoparticles of Preyssler Heteropolyacid Supported on Nano-SiO2

H14[NaP2W9O34]/SiO2 Catalyst

To a solution of the surfactant, sodium bis(2-ethylhexyl) sulphosuccinate, in cyclohexane (0.2 mol L−1), a solution of Preyssler acid in a specified amount of water was added. The molar ratio of water to surfactant was selected to be 3, 5 and 7. Tetrachoxysilane (TEOS) was then added to the micro-emulsion phase. After mixing for various times (8, 12, 18, 25 and 30 h) at room temperature, dispersed Preyssler acid/SiO2 nanostructures were centrifuged and the particles were rinsed with acetone (4 times) and dried in a vacuum oven. The optimum ratio of water to surfactant was 3:1 and the optimum time was 30 h.

2.2.4. Preparation of Various Heteropolyacids Catalysts

The catalysts of H3[P2Mo11V09O40], H2[PMo10V1O39], H5[PMo9V5O38], H2[PMo9V6O38] and Wells-Dawson, H3[P2W18O62] were prepared in accordance to the literature [27-35]. H3[P2W18O62], H3[PMo9V6O38], H3[PMo9V5O38], H5[PMo9V5O38] and H2[PMo10V09O39] were prepared according to the literatures [35, 36]. The integrity of the synthesized heteropolyacids has been proven by comparing of spectral data with those reported in literatur [25, 29, 37, 38].

2.3. Synthesis of Substituted Pyrazoline Derivatives

2.3.1. Procedure for the Synthesis of Substituted Chalcone Derivative

A solution of sodium hydroxide (40%) in water and rectified spirit was placed in a flask provided with a mechanical stirrer. The flask was immersed in a bath of crushed ice. Substituted acetophenone (0.008 mol) was poured with constant stirring. Substituted benzaldehydes (0.008 mol) was added to the solution. The temperature of the mixture was kept at room temperature (25 °C) and stirred vigorously until the mixture was thick enough to retard the stirring (5 h). The stirrer was removed and the reaction mixture was kept at 5 °C overnight. The product was filtered.
with suction on a buchner funnel, washed with cold water until the washings were neutral to litmus and then with ice cold ethanol. The crude product was recrystallized from ethanol.

2.3.2. Procedure for the Synthesis of Substituted Pyrazoline Derivatives

In a mixture of substituted chalcone (0.02 mol) in nanoparticles of Preyssler heteropolyacid supported on Nano-SiO$_2$, H$_4$[NaP$_5$W$_{30}$O$_{110}$]/SiO$_2$ as catalyst (0.05 mmol), glacial acetic acid (1 mL), ethanol (60 mL), hydrazine hydrate (0.04 mol) was added drop wise in a round bottom flask. The reaction mixture was heated under reflux for appropriate time on a water bath and then the reaction was continued for a certain period of time as required for completion (monitored by TLC). The reaction mixture was then filtered to separate the catalyst and this solvent followed with addition of ice cold water at room temperature. The mixture was kept overnight at 5 °C. The precipitates were filtered, washed with distilled water and dried. The product was recrystallized with ethanol to get final product.

2.4. Selected Spectral Data

3-(4-Chlorophenyl)-1,3-Diphenyl-2-Pyrazoline (5a):
IR (KBr, cm$^{-1}$): v 1120, 1506, 1591. $^1$H NMR (300 MHz, CDCl$_3$): δ$_H$ 3.13 (dd, $J = 7.1, 17.0$ Hz, 1H), 3.89 (dd, $J = 12.2, 17.1$ Hz, 1H), 5.30 (dd, $J = 7.3, 12.4$ Hz, 1H) 6.83-7.65 (m, 14H). $^{13}$C NMR (100 MHz, CDCl$_3$): δ$C$ 42.36, 61.30, 113.51, 117.25, 126.80, 126.92, 128.63, 129.16, 129.39, 130.56, 132.15, 132.18, 136.04, 139.60, 143.70, 147.38. Anal. calcld. for C$_{23}$H$_{18}$N$_2$: C 84.85, H 5.72, N 9.43; found C 84.81, H 5.37, N 9.47.

5-(4-Methoxyphenyl)-1,3-Diphenyl-2-Pyrazoline (5b):
IR (KBr, cm$^{-1}$): v 1120, 1263, 1511, 1595. $^1$H NMR (300 MHz, CDCl$_3$): δ$_H$ 3.11 (dd, $J = 7.1, 17.1$ Hz, 1H), 3.80 (s, 3H, OCH$_3$), 3.85 (dd, $J = 12.1, 16.9$ Hz, 1H), 5.26 (dd, $J = 7.2, 12$ Hz, 1H) 6.75-7.83 (m, 14H). $^{13}$C NMR (100 MHz, CDCl$_3$): δ$C$ 44.04, 55.63, 64.15, 113.70, 114.45, 119.56, 126.40, 127.90, 128.48, 128.87, 129.18, 130.57, 133.20, 145.02, 145.34, 147.19. Anal. calcld. for C$_{23}$H$_{18}$N$_2$: C 84.62, H 6.41, N 8.97; found C 84.56, H 6.40, N 8.93.

5-(3-Bromophenyl)-1,3-Diphenyl-2-Pyrazoline (5c):
IR (KBr, cm$^{-1}$): v 1125, 1501, 1597. $^1$H NMR (300 MHz, CDCl$_3$): δ$_H$ 3.05 (dd, $J = 7.1, 17.0$ Hz, 1H), 3.33 (dd, $J = 12.1, 16.9$ Hz, 1H), 5.67 (dd, $J = 6.9, 12.7$ Hz, 1H) 6.80-7.73 (m, 14H). $^{13}$C NMR (100 MHz, CDCl$_3$): δ$C$ 42.36, 60.45, 113.33, 119.50, 124.22, 129.75, 128.07, 129.05, 129.15, 129.34, 130.58, 132.41, 133.18, 139.66, 145.25, 147.14. Anal. calcld. for C$_{23}$H$_{18}$BrN: C 85.85, H 5.72, N 9.43; found C 85.78, H 5.69, N 9.43.

5-(2,4-Dichlorophenyl)-1,3-Diphenyl-2-Pyrazoline (5d):
IR (KBr, cm$^{-1}$): v 1115, 1501, 1587. $^1$H NMR (300 MHz, CDCl$_3$): δ$_H$ 3.01 (dd, $J = 6.6, 17.6$ Hz, 1H), 3.96 (dd, $J = 12.5, 17.5$ Hz, 1H), 5.57 (dd, $J = 6.6, 12.2$ Hz, 1H), 6.69-7.70 (m, 13H). $^{13}$C NMR (100 MHz, CDCl$_3$): δ$C$ 41.54, 60.94, 113.51, 119.50, 124.30, 125.69, 127.42, 127.72, 128.61, 128.50, 128.59, 129.29, 129.55, 132.10, 133.92, 137.73, 144.40, 147.55. Anal. calcld. for C$_{24}$H$_{16}$Cl$_2$: C 68.67; H, 4.39; N, 7.62. Found: C, 68.73; H, 4.39; N, 7.71%.

5-(2-Chlorophenyl)-1,3-Diphenyl-2-Pyrazoline (5e):
IR (KBr, cm$^{-1}$): v 1122, 1498, 1593. $^1$H NMR (300 MHz, CDCl$_3$): δ$_H$ 3.05 (dd, $J = 4.8, 17.6$ Hz, 1H), 3.95 (dd, $J = 11.2, 17.7$ Hz, 1H), 5.62 (dd, $J = 4.7, 11.0$ Hz, 1H) 6.76-7.70 (m, 14H). $^{13}$C NMR (100 MHz, CDCl$_3$): δ$C$ 41.71, 46.15, 113.33, 119.27, 125.90, 127.52, 127.98, 128.34, 128.55, 128.88, 129.38, 129.86, 131.40, 132.24, 154.97, 144.47, 147.48. Anal. calcld. for C$_{24}$H$_{16}$Cl$_2$: C 75.78; H, 5.15; N, 8.41. Found: C, 75.83; H, 5.23; N, 8.38%.

5-(3-Chlorophenyl)-1,3-Diphenyl-2-Pyrazoline (5f):
IR (KBr, cm$^{-1}$): v 1123, 1304, 1590. $^1$H NMR (300 MHz, CDCl$_3$): δ$_H$ 3.05 (dd, $J = 6.8, 17.0$ Hz, 1H), 3.41 (dd, $J = 12.2, 17.2$ Hz, 1H), 5.65 (dd, $J = 6.9, 12.4$ Hz, 1H) 6.85-7.72 (m, 14H) ppm. $^{13}$C NMR (100 MHz, CDCl$_3$): δ$C$ 42.37, 61.54, 113.58, 119.60, 124.44, 127.79, 128.07, 129.92, 129.18, 129.48, 130.67, 132.53, 133.04, 135.04, 139.67, 144.84, 147.53. Anal. calcld. for C$_{24}$H$_{16}$Cl$_2$: C 85.85, H 5.72, N 9.43; found C 85.79, H 5.70, N 9.41.

3. Result and Discussion

The propenones (1a-h) were then reacted with hydrazines in the presence of silica-supported Preyssler nanoparticles, H$_{4}$[NaP$_5$W$_{30}$O$_{110}$]/SiO$_2$ catalyst to give pyrazolines derivaties (Table 1, 5a-h) and Scheme 1.
This reaction probably takes place via an appropriate α,β-unsaturated hydrazone intermediate followed by the attack of NH on the carbon-carbon double bond of the propenone moiety to give a pyrazoline ring.

**Table 1.** Synthesis of pyrazolines using silica-supported Preyssler nanoparticles, $H_{14}[NaP_{5}W_{30}O_{110}]/SiO_{2}$ catalyst and in presence of ethanol as solvent under reflux conditions.

3.2. Effects of the Solvent

Different organic solvents were examined for the reaction and we found that ethanol was the solvent of choice (Table 2). CH$_3$OH, CHCl$_3$ and THF proved to be almost as good as ethanol, with CH$_2$Cl$_2$ giving a slightly better yield than CCl$_4$. When the reactions were conducted in ethanol, the expected products were obtained in good yields and with better reaction times compared to organic solvents (Tables 1 and 2).

3.3. Effects of the Catalyst Type

Initially, we compared the catalytic performance of Preyssler and four Keggin-type heteropolyacids (H$_4$[NaP$_{3}$W$_{30}$O$_{110}$], H$_4$[PMo$_{11}$VO$_{40}$], H$_4$[PMo$_{11}$PO$_{30}$], H$_4$[PMo$_{11}$VO$_{40}$], H$_4$[PMo$_{11}$PO$_{30}$] and H$_4$[PMo$_{11}$PO$_{30}$] catalyst, in the synthesis of 5-(4-Methylphenyl)-1,3-diphenyl-2-pyrazoline (Table 1, entry 8, product 5h). The results are shown in Table 3. The yield of product decreases in the following order:

silica-supported Preyssler nanoparticles, H$_4$[NaP$_{3}$W$_{30}$O$_{110}$]/SiO$_2$>H$_4$[NaP$_{3}$W$_{30}$O$_{110}$]>H$_4$[PMo$_{11}$VO$_{40}$]>H$_4$[PMo$_{11}$PO$_{30}$]>H$_4$[PMo$_{11}$PO$_{30}$]>

H$_4$[PMo$_{11}$PO$_{30}$]

A plausible mechanism for the reaction of chalcone with phenylhydrazine in the presence of silica-supported Preyssler nanoparticles, H$_4$[NaP$_{3}$W$_{30}$O$_{110}$]/SiO$_2$ catalyst is also

3.1. Catalyst Recovery

In our experiments, the reusability of the catalyst were examined by repetitive use of the catalyst. The wet catalyst was recycled and no appreciable change in activity was noticed after three cycles (Table 1, entries 1, 2, 5-8).

Catalyst was reused over three runs.

Isolated yield.
4. Conclusion

Herein is reported a relatively simple and useful method for the synthesis of pyrazolines in good yield using silica-supported Preyssler nanoparticles, $\text{H}_{14}[\text{NaP}_5\text{W}_{30}\text{O}_{110}]$/SiO$_2$ catalyst in ethanol as solvent. This catalyst is a safe and recoverable heterogeneous system for promoting the synthesis of 1,3,5-triaryl pyrazoline. The advantages of this catalytic system is mild reaction conditions, short reaction times, high product yields, easy preparation of the catalysts, non-toxicity of the catalysts, stable, simple and clean work-up of the desired products. In addition, the catalyst can be recycled after washing ethanol followed by drying, and the catalysts can be reused several times but they will be less active. Therefore, the method is eco-friendly.
