Abstract: In sub-Saharan Africa, agricultural reforms such as market liberalization and loan schemes greatly affect the agricultural and industrial sectors. The withdrawal of government institutions and adoption of structural adjustment programmes (SAP) have not always been a win-win situation for the different stakeholders of the agricultural sector. This paper assesses the influence of market liberalization on the groundnut sector in Senegal. Using market variables including production, marketing and trade, it analyzes the market performance of groundnuts before and after market liberalization in 2010. The coefficient of variation and the corrected coefficient of variation for producer prices were applied and the results show that the values for both coefficient of variation and corrected coefficient of variation were higher in the pre-liberalization period. There was less volatility after market liberalization and prices were much higher in the post-liberalization period. Market liberalization has generally favoured farmers whereas it has been bad for local processing industries. It is necessary for the government to provide alternative policy interventions to achieve inclusive welfare from market liberalization.

Keywords: Market Liberalization, Groundnut Sector, Agriculture, Livelihoods, Senegal

1. Introduction

Agriculture plays an important role in the economic growth of many developing countries where it contributes towards food security, job creation, provision of raw material, and trade. For several decades, agricultural policies have formed the frameworks for development policies in many developing countries south of the Sahara [1, 2]. These policies represent a major tool used by international financial institutions to implement structural adjustment programs (SAP). Agricultural reforms which mainly advocate for market liberalization and withdrawal of government institutions have been the topic of several controversial debates. These debates have resulted from the inconsistency observed in the impacts of SAP and their differential implementation per country [1, 3].

Market reform and market liberalization often involve the process of reducing government regulations and restrictions in a market in exchange for greater private sector

participation as well as encourage long-term market efficiency and economic development [4-6]. This is because, liberalized markets are free from direct and physical controls imposed by governments. Though a majority of governments adopted these wide market-oriented economic strategies, the degree of market reforms varied significantly among countries and crops. While some countries such as Senegal implemented market liberalization according to SAP, many others reversed the proposed SAP measures [7-8].

Market reform policies aim at boosting a country's economic efficiency while enhancing the productivity of people and physical assets. Meanwhile, in the agricultural sector, market reforms are intended to stimulate a positive supply response by providing farmers with more incentives through higher prices and well-functioning markets. The critical driving force is the increase in producer income, middlemen and the processing industry [4].

In many countries south of the Sahara, these liberalization measures undertaken in the past three decades have been detrimental to the agricultural sector. Additionally, many

structural and institutional constraints limit agricultural output within these countries [9, 6]. These constraints include non-price factors, such as the state of infrastructure, availability of marketing services, credit, research and extension services, human capital development, and lack of agricultural reforms. Aside non-price factors, changes in both the physical and environmental dynamics such as rainfall, temperature and soil quality have consequential impacts on agricultural output [9].

In Senegal, agriculture is the mainstay and accounts for over 17% of the Gross Domestic Product (GDP).

Groundnuts top the chart of major cultivated crops with over 60% of agricultural GDP, 70% of agricultural population employment, 35% of the annual household income, a third of the country's arable land, and 80% of exports [10-11]. Groundnut is the main export crop in Senegal and from which rural households obtain over 73% of their annual income [10-12]. According to [13], groundnuts account for over 80% of farmers' cash income and export earnings. Therefore, groundnut production and marketing play an important role in the national economy and contribute considerably to the subsistence of populations, especially in rural areas. These groundnut products are exported mainly as oil or consumed as grilled or boiled peanuts, or processed into flour, peanut butter, and oil for local consumption [13, 11]. Groundnut output is first purchased by local milling companies via official marketing channels, which accounts for about 25% of the national production [14]. Producers are therefore compelled to sell most of their output via unofficial or parallel marketing channels at lower prices.

In Senegal, SAP over the past three decades has been consequential for agricultural output especially in the entire groundnut sector. This liberalization began in the 1980s but not into January 2010 when a further liberalized market allowed groundnut exports. Those involved in the sector were producers, middlemen and millers but after these three decades of lethargy involving direct (via marketing agencies) and indirect (via policies) intervention, the market was liberalized in 2010 [15]. Under this new measure of market liberalization, both foreign and domestic private traders could purchase groundnuts directly from farmers [15-16].

Senegal is the world's leading groundnut oil exporter and where well-functioning and efficient agricultural markets are crucial for the country's economic stability [11]. Also, pricing and marketing policies are among the main factors that affect profitability and competitiveness in the groundnut sector. These policies must be taken into account when discussing the development strategies of groundnuts in Senegal. Therefore, given the place of the groundnut sector in the national economy, it is important to analyze the impact of further liberalizing the market on the welfare of households and the profitability of agribusiness firms.

This paper assesses the socioeconomic impact of market liberalization on the groundnut sector in Senegal. It pays special attention to smallholder farmers in terms of output,

income and food security, and on processing industries in terms of processed quantity, exports and profits. From a wider perspective, in order to determine how to mitigate the negative effects of groundnut market liberalization, this paper examines issues related to the approaches and effects of agricultural market reforms in Senegal. Therefore, using data obtained from the Senegalese Institute for Agricultural Research (ISRA) and National Inter-professional Peanut Committee (CNIA), this study aims at understanding the socioeconomic impacts of market liberalization on the groundnut sector in Senegal. This study would contribute to the existing literature on agricultural trade liberalization, particularly its impact on the key players of the agricultural sector.

2. Materials and Methods

2.1. Description of Study Area

Senegal lies along the coast of northwest Africa with an estimated population of about 15 million inhabitants [17], [18]. It has a tropical climate with a dry season from November to May, and a rainy season from June to October. The dry season is dominated by the hot and dry Harmattan wind around Dakar (the capital city) with average maximum temperatures of 30°C and average minimum temperatures of 24.2°C. Between December and February at the peak of the dry season, maximum temperatures average 25.7°C and minimums 18°C [11]. Interior temperatures are higher than along the coast. For instance, average daily temperatures in Kaolack and Tambacounda for May are 30°C and 32.7°C respectively, compared to Dakar's 23.2°C.

In Tambacounda in the far interior, particularly along the border with Mali where the Sahara desert begins, temperatures can reach as high as 54°C. Generally speaking, the country is mostly very sunny and dry with average annual rainfall varying between 600 mm from the north in the Sahel to 1500 mm in the south along the West African coast. Consequently, the landscape varies considerably, being semi-desert in the north, while the south is occupied by the savanna, and with gallery forests along the rivers [11].

Therefore, Senegal's northernmost part has a near hot desert climate, the central part has a hot semi-arid climate and the southernmost part has a tropical wet and dry climate. An estimated 57% of the population lives in rural areas with agriculture being their major occupation. These rural areas of Senegal, due to over dependence on rain-fed agriculture and low household income face food security issues. These issues are also partly due to the effects of macro-economic shocks such as fiscal adjustments and monetary policy reforms and probably climate variations [11]. Apart from the lack of adequate income sources and resources for better livelihoods, these rural communities also face other challenges such as hunger, malnutrition, and lack of access to basic education, adequate healthcare facilities and involvement in the decision-making process [19].

Figure 1. Map of Senegal. Sourced from http://www.yeniasya.com.tr/dunya/senegal-ordusu-gambiya-ya-girdi_421572 11th September, 2017.

2.2. Data Collection

To understand the impact of market liberalization on the groundnut sector, data were gathered on factors that could influence annual production (yield). These included seed values; area under cultivation, yield, prices and quantity processed as well as rainfall, temperature, and exports. The data were obtained through interviews using close and open-ended recall questions, with Senegalese government officials from the Senegalese Institute for Agricultural Research (ISRA) and National Inter-professional Peanut Committee (CNIA), as well as officials from the Food and Agriculture Organization (FAO) and the World Bank (WB) offices in Senegal according to [20].

Data provided by the different sources were obtained between 2000 and 2016 and the ISRA, WB, FAO, and CNIA were selected based on their direct involvement and control of the Senegalese agricultural sector. In instances where potential participants were unable to effectively communicate in French language, the local Wolof language was used to ensure proper understanding. The questionnaires were designed so as to gain an understanding of how market

liberation has influenced groundnut production, marketing and trade in Senegal.

2.3. Data Analysis

The data were analyzed using Stata 13.0 and Excel 2011. Descriptive statistics were employed for understanding and analyzing the distribution of the data. Coefficient of Variation (CV) and Corrected Coefficient of Variation (CCV) were determined for analyzing the fluctuations of prices and their impact on farmers and processing mills. Meanwhile, Mean analysis to identify the direction of price volatility were also employed while Test of means and equality of variances to determine the statistical significance of results were also carried-out according to [21, 22].

3. Results

3.1. Meteorological Variations

Figure 2 shows graphical representation of variability in mean annual rainfall in millimeters from 2000 to 2015 for Senegal. There are significant variations in inter-annual rainfall throughout the 15-year period with consistent drop in

rainfall peaks from 2000-2002, a rise from 2002-2003 and no particular trends between 2003 and 2015, figure 2.

Figure 2. Variation in mean annual rainfall for the period 2000-2015 (mm) in Senegal.

Figure 3 illustrates graphical representation of variability mean annual temperatures ($^{\circ}\text{C}$) from 2000 to 2015. Though temperatures have been rising and falling since 2000, it is only in 2015 that a peak is observed between 2012 and 2015 where, 2015 recorded the highest mean annual temperatures of 29.8°C , figure 3.

Figure 3. Variation in mean annual temperature for the period 2000-2015 ($^{\circ}\text{C}$).

3.2. Groundnut Production

Groundnut production in Senegal increased in the post-liberalization period (2010-2016) with an annual average production of 843047.9 tons against 645382.5 tons in the pre-liberalization period (2000-2009). However, there existed some wide fluctuations in both periods, tables 1 and 2. During the pre-liberalization period, groundnut production was as low as 260723 tons in the marketing year 2002/2003 and as high as 1032651 between 2009 and 2010. During the post-liberalization period, output was as high as 1286855 tons in 2010/2011, which is the year of market liberalization, and as low as 527528 tons in 2011/2012.

Table 1. Groundnut production during the pre-liberalization period 2000-2009 (tons).

	Mean	Std. Dev.	Skewness	Kurtosis
Production	645382.5	273271.3	0.0924184	1.70463
Land	790705.1	180871.9	0.0565453	1.895432
Yield	798.3	211.5824	-1.339746	3.653656
Rainfall	141.2453	22.45983	-0.4577956	2.284731
Temperature	29.12646	0.2847999	-0.3433102	2.865683

Table 2. Groundnut production during the post-liberalization period 2010-2016 (tons).

	Mean	Std. Dev.	Skewness	Kurtosis
Production	843047.9	271869.4	0.4960425	1.896595
Land	950174.4	182235.3	0.2203394	1.798738
Yield	847.9564	173.7804	-0.0464976	1.703549
Rainfall	149.099	19.80677	0.3681278	2.14966
Temperature	29.36993	0.3163169	0.2862866	1.586645

3.3. Groundnut Marketing

The average quantity of groundnuts collected by millers in the post-liberalization period (124825 tons) is about half of what was collected in the pre-liberalization period (212048 tons). There was no significant increase in the quantity collected for crushing purposes. For instance, from 1286855 tons produced in 2010/2011, only about 257349 tons were used for crushing, figure 4. The percentage of output used for processing fell from 55% in 2000/2001 to an all-time low of 4% in 2015/2016. The best and worst performances of the groundnut sector in terms of quantity collected by millers

were respectively before and after market liberalization.

Figure 4. Groundnut production and quantity collected for processing between 2000 and 2016.

3.4. Groundnut Trade

The quantity of groundnut oil exported by millers in Senegal decreased over the years from 112876 tons in 2000/2001 to 13008 tons in 2015/2016 or approximately 88%, figure 5. During the 5 years preceding market liberalization, the average groundnut oil export was 41559 tons compared to the 30645 tons of the 5-year post-liberalization period.

Figure 5. Groundnut oil exports from Senegal for 2000-2015 (tons).

3.5. Impact of Market Liberalization on Producer Prices

This section will assess the impact of market liberalization by using the CV and CCV to analyze the variations of producer prices in the pre- and post-liberalization periods, and the two-sample t-test to ascertain the significance of observed changes.

3.5.1. Coefficient of Variation and Corrected Coefficient of Variation of Producer Prices

Table 3. CV and CCV of the level of official producer prices.

	Pre-liberalization (2000-2009)		Post-liberalization (2010-2016)	
	CV	CCV	CV	CCV
Prices	10.86	5.86	8.35	2.84

From table 3, it can be seen that producer prices were more volatile during the pre-liberalization period because the CV is 10.86, which is greater than that for the post liberalization

period of 8.35. The CCV confirms this result because 5.86 is greater than 2.84.

3.5.2. Two-Sample t-Test for the Equality of Means

The Welch-Satterthwaite version of the t-test was used to compare the difference in official producer prices before and after market liberalization. Similarly, the accuracy of the results was tested using the Welch command in Stata 3.0. With $P < 0.05$, the null hypothesis (H_0) can be rejected, meaning that the sample means are different. This implies that, prices in the pre- and post-liberalization periods were different. Therefore, the mean difference is negative because post-liberalization prices were subtracted from pre-liberalization prices. Thus, the mean difference shows groundnut producer prices to be higher after market liberalization, table 4.

Table 4. Two-sample *t* test with unequal variances.

Group	Observations	Mean	Standard Error	Standard Deviation	95% Confidence Interval
0	10	145.6	5.002666	15.81982	134.2832 156.9168
1	7	191.4286	6.046869	15.99851	176.6324 206.2247
Combined	17	164.4706	6.761764	27.87947	150.1363 178.8049
Difference		-45.82857	7.848012	-62.7868	-28.87034

Diff = mean (0) - mean (1); $t = -5.8395$

Ho: diff = 0; Satterthwaite's degrees of freedom = 12.9727

Ha: diff < 0; Ha: diff = 0; Ha: diff > 0

Pr ($T < t$) = 0.0000; Pr ($|T| > |t|$) = 0.0001; Pr ($T > t$) = 1.0000

4. Discussion

4.1. Groundnut Production During the pre and Post-Liberalization Periods

During the post-liberalization period, there was a significant increase in the annual average production than during the pre-liberalization period. This increase might be attributed to other factors of production such as seed quality, market price, increase in fertilizer application and area under cultivation. Despite this variation and increase in production, changing ecological conditions such as rainfall, temperatures, pests and diseases may have affected optimum yield [23], [20]. For instance during the 15-year period, the area under cultivation increased by over 17%. This increase brought with it an increase in the quantity of seeds planted; hence groundnut yield follows the trend of cultivated area.

4.2. Meteorological Conditions and Groundnut Production

The variability in Senegal's ecological zones has an impact on the climate system throughout most of the year. These ecological zones provide for variability in ecological factors including temperature and rainfall variability, soil degradation, pests, and disease. These variations such as decrease in mean monthly rainfall and increase in average monthly temperatures are consequential for crop growth and yield [24, 20].

For instance, in Senegal the rainy season is between June and September, typically providing just sufficient water for crops and livestock [25]. Therefore, significant variations usually visualized as a reduction of the areas receiving adequate rainfall for viable agricultural livelihoods, may have retroacted on crop production throughout the 15-year period. This is because, rainfall variability such as duration of the rainy season, number of rainy days and amount of rainfall during each precipitation event, affect crops such as groundnuts, cassava and maize yields [20].

Typically, groundnuts require between 500 mm and 700 mm of rain in order to achieve good yields. It is therefore obvious that rainfall variability during the growing season, will greatly affect food crop planting regimes [26, 27, 20]. According to [23, 24], these variations also affect rates of soil erosion and moisture which are prerequisites for staple food crops such as groundnuts, wheat, rice, millet, sorghum, and maize yields. In addition, ground and soil water fluxes are altered as a result of rainfall variability with a consequence

for the cropping cycle [28, 29, 23].

Since 2000, average annual temperatures have increased by almost 0.9°C across much of Senegal [30, 11]. Such transitions to warmer climates may limit crop growth and yields as a result of drought effects. As such, regional warming due to very high average air temperatures, often exacerbate the impact of water shortages [31].

4.3. Market Liberalization and Groundnut Marketing

Marketing is done through official channels, where minimum prices are set by the CNIA and to local groundnut oil-producing companies. Other farmers sell their produce to licensed exporters and in the informal sector where prices are determined through weekly spot market forces. The market in the informal sector is open all year round and smallholder farmers can sell at higher or lower prices [6]. These buyers include anyone who is willing to buy including small-scale crushing plants and exporters. Therefore, given the importance of groundnut production in Senegal, producer price levels and trends have serious implications for household food security.

Official groundnut producer prices are relatively more stable in the post-liberalization period with relatively higher post-liberalization prices. This price disparity suggests a significant welfare gains for groundnut producers during this period. According to [22], market liberalization can achieve enhanced welfare only by enabling farmers to sell their produce at the highest price in a stable and predictable market. Therefore, by resulting in more stable and relatively higher prices, the liberalization of groundnut market in Senegal is beneficial to farmers. This is because price stability affects the allocation of farmers' limited resources and behaviour. It also increases farmer confidence in the market and food security [32]. By selling at favourable prices, farmers acquire more income while keeping sufficient groundnut stocks for seed and consumption purposes. Moreso, farmers can invest in other inputs for the upcoming growing season while strengthening their purchasing power for other daily foodstuff.

According to [27], since 2012, foreign buyers' especially the Chinese, have been offering smallholder farmers prices up to 30% higher than the CNIA. This higher demand which overweighs supply has seen a rise in market prices bringing with it an increase in the number of groundnut stocking centers [27, 33, 34]. These new buyers provide producers with more market options for selling their nuts

and a competitive price advantage. Hence, market liberalization has redistributed revenue transfers in favour of producers. This implies that market reforms have reversed the long-standing discrimination of groundnut farmers [15].

4.4. Market Liberalization and Groundnut Trade

The quantity of groundnuts produced during the pre-liberalization period (2000-2009), was a major force behind groundnut market liberalization in Senegal. In this regard, Decree No. 2010-15 of 13th January 2010 allowed the exports of all groundnuts except seeds. The decree further paved way for a Memorandum of Understanding (MOU) to be signed between Senegal and China, thus authorizing Chinese traders to purchase groundnuts for export purposes. Groundnut exports from Senegal have preferential access to the Chinese market since no taxes are required which has resulted into large quantities of groundnut exports towards China.

This has made it difficult for local processing mills to acquire raw materials for oil production. Furthermore, it has caused a distortion regarding domestic producer prices, since unprocessed groundnut exports are duty-free, whereas groundnut oil exports are not.

4.5. Market Liberalization and Groundnut Processing

Official groundnut producer prices are relatively more stable and higher in the post than in the pre-liberalization period. Therefore, market liberalization has been less beneficial to local groundnut oil-producing industries which use locally produced groundnuts as raw materials. Market liberalization policies have also affected the profitability of processing activities and revenue transfers between production and processing sectors.

In Senegal, market liberalization has increased prices and hence the cost of raw materials for processing industries. Foreign groundnut exporters, purchase large groundnut quantities from smallholder farmers resulting to local price hikes. These price hikes, make it extremely difficult for local millers to satisfy their demand for raw materials. These new dynamics have caused local processing industries to operate at a minimum level due to the shortage of raw materials. For instance, groundnut oil-processing industries only collected 7.06% of target groundnut quantity in 2015/2016.

Many groundnut oil-processing industries such as Nouvelle Valorisation d'Arachide du Senegal (NOVASEN) have ceased production and laid-off staff. NOVASEN for instance shutdown in June 2013, because it could only acquire 30% of the groundnuts it needed to operate at an optimal capacity [35]. Furthermore, market liberalization impacts in Senegal are related to the profitability and competitiveness of groundnut processing activities.

5. Conclusion

This study examined the market liberalization in Senegal

and how it influences the groundnut sector especially farmers and processing industries. The study also compared the performance of the groundnut sector during the pre and post-liberalization periods, in terms of production, marketing, and trade. It showed that market liberalization has various effects on the different players of the groundnut sector. On one hand, the results show that liberalization has been good for farmers on at least three different levels: providing more choice of buyers, delivering prompt cash payments, and providing relatively high producer prices. On the other hand, market liberalization has had devastating consequences for local processing mills: due to the entry of new buyers who make better offers to farmers, local millers are having trouble procuring the groundnut quantities they need to operate at an optimum capacity.

The distributional effects of market liberalization should also be considered, as this will directly distribute revenues into groundnut-producing rural areas. Besides, groundnut exports have a huge impact on the terms of trade in a country like Senegal where imports are much higher than exports.
