Abstract: The solutions of the Schrödinger equation with Kratzer plus Modified Deng-Fan potential have been obtained using the parametric Nikiforov-Uvarov (NU) method which is based on the solutions of general second-order linear differential equations with special functions. The bound state energy eigenvalues and the corresponding un-normalized eigen functions are obtained in terms of Jacobi polynomials. Also special cases of the potential have been considered and their energy-eigen values obtained.

Keywords: Schrödinger, Kratzer, Deng-Fan, Eigen Energy

1. Introduction

The exact analytic solutions of nonrelativistic and relativistic wave equations are only possible for certain potentials of physical interest. It is well known and understood that the analytical exact solutions of these wave equations are only possible in a few cases such as the harmonic oscillator, Coulomb, pseudoharmonic potentials and others [1]. For \( l \neq 0 \) approximation techniques have to be employed to deal with the centrifugal term like the Pekeris approximation [2, 3] and the approximated scheme suggested by Greene and Aldrich. Some of these exponential-type potentials include the Hulthen potential [4], the Morse potential [5], the Woods-Saxon potential [3], the Kratzer-type and pseudoharmonic potentials [3, 2], the Rosen-Morse-type potentials [6], the Manning-Rosen potential [3]. Recently our groups have attempted to study the bound state solutions of Klein-Gordon, Dirac and Schrodinger equations using combined or mixed potentials. Some of which includes Woods-Saxon plus Attractive Inversely Quadratic potential (WSAIQP) [7], Manning-Rosen plus a class of Yukawa potential (MRCYP) [8], generalized wood-saxon plus Mie-type potential (GWSMP) [9], Kratzer plus Reduced Pseudoharmonic Oscillator potential (KRPHOP)[10, 2], Inversely Quadratic Yukawa plus attractive radial potentials (IQYARP) [11], Modified Echart Plus Inverse Square Molecular Potentials (MEISP) [12]. The Deng-Fan molecular potential is a simple modified Morse potential called the generalized Morse potential, which was proposed by Deng and Fan in 1957 [13], in an attempt to find a more suitable diatomic potential to describe the vibrational spectrum [14]. Although, this potential is qualitatively similar to the Morse potential but it has correct asymptotic behavior as the internuclear distance approaches to zero [15]. This potential has been used to describe diatomic molecular energy spectra and electromagnetic transitions, and it is an ideal internuclear potential in diatomic molecules with the same molecular
behavior [15]. However, not much has been achieved in the area of solving the relativistic Schrödinger equation with Kratzer plus Modified Deng-Fan potential (KMDFP) using Nikiforov-Uvarov (NU) method which is the purpose of this paper. This study is organized as follows: Section 2 contains the overview of the Nikiforov-Uvarov method. In Section 3, the Schrödinger equation with Kratzer plus Modified Deng-Fan potentials (KMDFP) is solved by using the Nikiforov-Uvarov method. The relativistic energy equations and the corresponding unnormalized wave functions are obtained and finally, the conclusion is given in Section 4.

2. Review of Parametric Nikiforov-Uvarov Method

The NU method is based on the solutions of a generalized second order linear differential equation with special orthogonal functions. The Nikiforov-Uvarov method has been successfully applied to relativistic and nonrelativistic quantum mechanical problems and other field of studies as well [6-9]. The hypergeometric NU method has shown its well [6-9]. The hypergeometric NU method has shown its

The parameters obtainable from equation (3) serve as important tools to finding the energy eigenvalue and eigenfunctions. They satisfy the following sets of equation respectively

\[ c_2 n - (2n+1)c_3 + (2n+1)(\sqrt{c_9} + c_9 \sqrt{c_0}) + n(n-1)c_3 + c_7 + 2c_3 c_8 + 2\sqrt{c_8 c_0} = 0 \]  

(4)

\[ (c_2 - c_3)n + c_3 n^2 - (2n+1)c_5 + (2n+1)(\sqrt{c_9} + c_9 \sqrt{c_0}) + c_7 + 2c_3 c_6 + 2\sqrt{c_6 c_0} = 0 \]  

(5)

The wave function is given as

\[ \Psi_n(s) = N_n S_n \left(1 - c_5 s^2\right)^{-\frac{c_1}{c_3} - \frac{c_1}{c_3} P_n \left(c_{10}^{-1} - \frac{c_{10}^{-1}}{2} c_5 s\right)} \]  

(6)

Where

\[ c_4 = \frac{1}{2} (1 - c_1), \quad c_5 = \frac{1}{2} (c_2 - 2c_3), \quad c_6 = c_5^2 + \epsilon_1, \quad c_7 = 2c_4 c_5 - \epsilon_2, \quad c_8 = c_4^2 + \epsilon_3, \quad c_9 = c_2 c_7 + c_2^2 c_6 + c_6, \quad c_{10} = c_4 + 2c_4 + 2\sqrt{c_8}, \quad c_{11} = c_2 - 2c_5 + 2(\sqrt{c_0} + c_3 \sqrt{c_8}) \]

\[ c_{12} = c_4 + \sqrt{c_8}, \quad c_{13} = c_5 - (\sqrt{c_9} + c_3 \sqrt{c_0}) \]  

(7)

and \( P_n \) is the orthogonal polynomials.

This can also be expressed in terms of the Rodriguez’s formula

\[ P_n^{(\alpha, \beta)}(x) = \frac{1}{2^{n+\alpha} n!} (x - 1)^{-\alpha} (x + 1)^{-\beta} \frac{d^n}{dx^n} \left((x - 1)^{\alpha+1}\right) \]  

(8)

The Schrodinger Equation with vector \( V(r) \), potential in atomic units (\( h = c = 1 \)) is given as

\[ \frac{d^2 \Psi(r)}{dr^2} + \frac{2 \mu}{h^2} \left\{ (E - V(r)) \right\} \Psi(r) = 0 \]

(9)

Where \( E, V(r) \), \( h \) are total energy, potential and planck’s constant respectively.

The Modified Deng-Fan Potential [13], is given as

\[ V(r) = -\left( A_1 + \frac{A_2}{1-r} + \frac{A_3}{(1-r)^2} \right) \]

(10)

Where \( A_1, A_2 \) and \( A_3 \) are constant that depends on the dissociation energy.

The Kratzer Potential [17], is given as

\[ V(r) = \frac{V_{de}}{1 - e^{-ar}} \]

(11)

Where, screening parameter \( e \) determines the range of the potential, and \( V_{de} \), is the coupling parameter describing the depth of the potential well. In general term, the hyperbolic functions are defined as

\[ \sinh_q(r) = \frac{1}{\cosh_q(r)} = \frac{e^{r} - e^{-r}}{2}, \quad \cosh_q(r) = \frac{e^{r} + e^{-r}}{2}, \quad \coth_q(r) = \frac{\cosh_q(r)}{\sinh_q(r)} \]

(12)

Making the transformation \( s = e^{-2ar} \) the sum of the potentials (KMDFP) in equations (10) and (11) becomes...
\[ V(r) = - \left( A_1 + \frac{A_2}{(1-s)^2} + \frac{A_3}{(1-s)^4} + \frac{V_1 s}{1-s} \right) \]  

Substitute eq. (12) into the Schrodinger equation given in equation (9) we have

\[
\frac{d^2 R(r)}{dr^2} + \frac{2\mu}{\hbar^2} \left[ E + \left( A_1 + \frac{A_2}{(1-s)^2} + \frac{A_3}{(1-s)^4} + \frac{V_1 s}{1-s} \right) \right] R(r) = 0 \tag{14}
\]

Applying the Pekeris-like approximation [16] given as \( \frac{1}{r^2} = \frac{4\alpha^2}{(1-s)^2} \) to eq. (14) enable us completely solve eq. (9).

Again, applying the transformation \( s = e^{-2\alpha r} \) to get the form that NU method is applicable, equation (9) gives a generalized hypergeometric-type equation as

\[
\frac{d^2 R(s)}{ds^2} + \left( \frac{\mu}{2\alpha^2 s^2} - \frac{1}{(1-s)^2} \right) \frac{dR(s)}{ds} + \left( \frac{1}{(1-s)^2} - 2(2\beta^2 + B + K) \right) R(s) + \left( P - K - 2B - 4\beta^2 \right) s + \left( (2\beta^2 + H + B + P) \right) R(s) = 0 \tag{15}
\]

Where

\[
\beta^2 = \left( \frac{\mu}{4\alpha^2 s^2} \right), \quad B = \left( \frac{\mu}{2\alpha^2 s^2} \right) A_1, \quad k = \left( \frac{\mu}{2\alpha^2 s^2} \right) V_1, \quad P = \left( \frac{\mu}{4\alpha^2 s^2} \right) A_2, \quad H = \left( \frac{\mu}{2\alpha^2 s^2} \right) A_3 \tag{16}
\]

Comparing equation (14) with equation (2) yields the following parameters

\[ c_1 = c_2 = c_3 = 1, c_4 = 0, \]

\[ c_5 = \frac{1}{2}, c_6 = \frac{1}{4} + 2\beta^2 + B + K, \]

\[
E = \frac{4\alpha^2 s^2}{\mu} \left\{ - \left( \frac{2(\mu/2\alpha^2 s^2)}{A_2} + \left( \frac{\mu}{2\alpha^2 s^2} \right) \right) \left( 1 + \frac{(2\beta^2 + H + B + P)}{2} \right) \left( \frac{\mu}{2\alpha^2 s^2} \right) \left( A_3 \right) \right\} - \left( \frac{\mu}{2\alpha^2 s^2} \right) A_1 + \left( \frac{\mu}{2\alpha^2 s^2} \right) A_2 \tag{19}
\]

We now calculate the radial wave function of the KMDFP as follows

\[
\rho(s) = s^u (1 - qs)^v \tag{20}
\]

Where \( u = 2\beta^2 - R - B + \lambda \) and \( v = 2\left[ \frac{1}{4} - B - H - P + \lambda \right] \)

\[
X_n(s) = p_n^{(u,v)}(1 - 2s) \tag{21}
\]

\[
\phi(s) = s^\alpha (1 - s)^\beta \tag{22}
\]

Using equation (16) we get the function \( \chi(s) \) as

\[
\chi(s) = p_n^{(u,v)}(1 - 2s) \tag{23}
\]

Where \( p_n^{(u,v)} \) are Jacobi polynomials

Lastly,

\[
\phi(s) = s^{c_1 + \frac{1}{2}} (1 - c_3 s)^{c_2 - \frac{c_3}{c_5}} \tag{24}
\]

And using equation (16) we get

\[
\phi(s) = s^{u/2} (1 - s)^{v-1/2} \tag{25}
\]

\[ c_7 = -4\beta^2 - 2B + P - K, \]

\[ c_8 = 2\beta^2 + H + B + P, \]

\[ c_9 = \frac{1}{4} + H, \]

\[ c_{10} = 1 + 2\sqrt{2\beta^2 + H + B + P}, \]

\[ c_{11} = 2 + 2\left( \frac{1}{4} + H + \sqrt{2\beta^2 + H + B + P} \right), \]

\[ c_{12} = \sqrt{2\beta^2 + H + B + P}, \]

\[ c_{13} = \frac{1}{2} - \left( \frac{1}{4} + H + \sqrt{2\beta^2 + H + B + P} \right), \]

\[ \epsilon_1 = 2\beta^2 + B + K, \quad \epsilon_2 = 4\beta^2 + 2B - P + K, \quad \epsilon_3 = 2\beta^2 + H + B + P \tag{17} \]

Now using equations (6), (16) and (17) we obtain the energy eigen spectrum of the KMDFP as

\[
\beta^2 = \left\{ \frac{(2P + B + H) - (n^2 + n - \frac{1}{2}) - (2n + 1) \mu}{(2n + 1) + 2(\sqrt{\nu} + H)} \right\}^2 - (B + P + H) \tag{18}
\]

The above equation can be solved explicitly with the substitution of values, equation (18) yields the explicit energy eigen spectrum of KMDFP as

\[
R_n(s) = N_n \phi(s) \chi_n(s) \tag{26}
\]

We then obtain the radial wave function from the equation

\[
R_n(s) = N_n s^{u/2} (1 - s)^{v-1/2} p_n^{(u,v)}(1 - 2s) \tag{26}
\]

Where \( n \) is a positive integer and \( N_n \) is the normalization constant

4. Discussion

We consider the following cases from equation (19)

CASE I: If we choose \( A_1 = A_2 = A_3 = 0 \) then the energy eigen values of the Kratzer potential becomes

\[
E = \frac{4\alpha^2 s^2}{\mu} \left\{ \left( \frac{n^2 + n - \frac{1}{2}}{(2n + 1)} \right)^2 \right\} \tag{27}
\]

CASE II: If we choose \( V_1 = 0 \) then the energy eigen values of the Deng-Fenf potential becomes
\[ E = \frac{4a^2\hbar^2}{\mu} \left\{ \frac{-(\mu \left( \frac{\hbar}{2a^2\hbar^2} \right) A_1 + \left( \frac{\hbar}{2a^2\hbar^2} \right) A_2) - (n^2 + n - \frac{1}{2})}{(2n+1)^2} \right\} \left\{ \frac{3\lambda + \left( \frac{\mu}{2a^2\hbar^2} \right) A_3}{(2n+1)^2} \right\} = \left( \frac{\mu}{2a^2\hbar^2} \right) A_2 + \left( \frac{\mu}{2a^2\hbar^2} \right) A_1 + \left( \frac{\mu}{2a^2\hbar^2} \right) A_3 \right) \] (28)

\[
\text{CASE III: when } A_1 = A_2 = A_3 = A, \text{ then equation (19) becomes}
\]

\[
E = \frac{4a^2\hbar^2}{\mu} \left\{ \frac{3A + \left( \frac{\mu}{2a^2\hbar^2} \right) A_3}{(2n+1)^2} \right\} = \left( \frac{\mu}{2a^2\hbar^2} \right) \left( 3A \right) \] (29)

5. Conclusion

The Schrödinger equation for the sum of KP and MDFP referred to as KMDFP has been solved and solutions obtained using the Nikiforov-Uvarov (NU) method. The corresponding unnormalized eigen functions are evaluated in terms of Jacobi polynomials. Interestingly, the Klein-Gordon and Dirac equation with the arbitrary angular momentum values for this potential can be solved by this method. The resulting eigen energy equations can be used to study the spectroscopy of some selected diatomic atoms and molecules.
