Abstract: Characterizing a distribution is an important problem in applied sciences, where an investigator is vitally interested to know if their model follows the right distribution. To this end, the investigator relies on conditions under which their model would follow specifically chosen distribution. Certain characterizations of the Marshall-Olkin discrete reduced modified Weibull distribution are presented to complete, in some way, their work.

Keywords: Discrete Marshall-Olkin distribution, Discrete Weibull Distribution, Discrete Distributions, Hazard Function, Characterizations

1. Introduction

The problem of characterizing a distribution is an important problem in applied sciences, where an investigator is vitally interested to know if their model follows the right distribution. To this end, the investigator relies on conditions under which their model would follow specifically chosen distribution. [1] introduced a new discrete probability model called "Marshall Olkin Discrete Reduced Modified Weibull (MDRMW)" distribution to compete against some of the well-known discrete distributions. In this very short note, we present two characterizations of MDRMW distribution based on: (i) conditional expectation of certain function of the random variable and (ii) the hazard rate function. We would like to mention here some of the recently introduced discrete distributions for the interested readers: (a) Discrete Logistic (DLOG) distribution [2]; (b) a discrete version of normal (DN1) distribution [3]; (c) Discrete Rayleigh (DR) distribution [4]; (d) Discrete Normal (DN2) [5]; (e) Discrete Weibull Type III (DWTIII) distribution [6]; (f) Discrete Gamma (DG) [7]; (g) Discrete Beta-Exponential (DBE) [8]; (h) Generalization of Geometric (GOG) distribution [9] and (z) A New Generalized Poisson-Lindley (ANGPL) Distribution of [10]. For a detailed treatment of each one of these distributions and their domain of applicability, we refer the interested reader to the corresponding paper cited in the references. We certainly hope that the contents of this work will be useful to a good number of researchers whose model follows the MDRMW distribution. The cumulative distribution function (cdf), $F(x)$, and the corresponding probability mass function (pmf), $f(x)$, hazard rate function, $h(x)$, of MDRMW are given, respectively, by

$$F(x; \beta, q, b, c) = \frac{1 - q}{\beta q} x^{\alpha} (1 - q^x), \quad x \in \mathbb{N}^+$$

(1)
\[ f(x; \beta, q, b, c) = \beta \left( \frac{q^x b^x}{1 - \beta q} + \frac{q^{x+1} b^{x+1}}{1 - \beta q} \right), \quad x \in \mathbb{N}^* \] (2)

\[ h(x; \beta, q, b, c) = \frac{q^x b^x}{1 - \beta q} + \frac{q^{x+1} b^{x+1}}{1 - \beta q}, \quad x \in \mathbb{N}^* \] (3)

Where \( \beta, b, c \) all positive and \( q \in (0, 1) \) are parameters and \( \mathbb{N}^* = \{0\} \cup \mathbb{N} \) (\( \mathbb{N} \) is the set of all positive integers).

### 2. Characterization Results

We present our characterizations (i) and (ii) mentioned in the Introduction via two subsections 2.1 and 2.2, as follows.

#### 2.1. Characterizations of MDRMW in Terms of the Conditional Expectation of Certain Function of the Random Variable

Proposition 2.1.1. Let \( X: \Omega \to \mathbb{N}^* \) be a random variable. The pmf of \( X \) is (2) if and only if

\[ E\left( \frac{x^k b^x}{1 - \beta q} \right) \quad \text{if and only if} \quad \frac{x^k b^x}{1 - \beta q} = \frac{x^{k+1} b^{x+1}}{1 - \beta q} \quad \text{is valid for all} \quad x \in \mathbb{N}^* \quad \text{and} \quad k \in \mathbb{N}^* \] (4)

Proof. If has pmf (2), then the left-hand side of (4) will be

\[ (1-F(k))^{-1} \sum_{x=k+1}^{\infty} \beta \left( \frac{q^x b^x}{1 - \beta q} \right)^2 = \frac{q^{k+1} b^{k+1}}{1 - \beta q} \left( \frac{q^x b^x}{1 - \beta q} \right)^2 \quad \text{for} \quad x \in \mathbb{N}^* \] (5)

Conversely, if (4) holds, then

\[ \sum_{x=k+1}^{\infty} \left( \frac{q^x b^x}{1 - \beta q} \right)^2 = \frac{q^{k+1} b^{k+1}}{1 - \beta q} \quad \text{for} \quad x \in \mathbb{N}^* \] (6)

From (4), we also have

\[ \sum_{x=k+1}^{\infty} \left( \frac{q^x b^x}{1 - \beta q} \right)^2 = \frac{q^{k+1} b^{k+1}}{1 - \beta q} \quad \text{for} \quad x \in \mathbb{N}^* \] (7)

Now, subtracting (6) from (5), we arrive at

\[ \left[ 1-F(k+1) \right] \left( \frac{q^{k+1} b^{k+1}}{1 - \beta q} \right)^2 - \frac{q^{k+1} b^{k+1}}{1 - \beta q} = \frac{q^{k+1} b^{k+1}}{1 - \beta q} \left( \frac{q^{k+1} b^{k+1}}{1 - \beta q} \right)^2 \]

From the last equality, we have
\[
F(x) = \begin{cases} 
\frac{1}{\beta} x^{\beta-1}, & 0 < x < 1 \\
0, & \text{otherwise} 
\end{cases}
\]

Which, in view of (3), implies that has pmf (2).

### 2.2. Characterization of MDRMW Based on the Hazard Function

Proposition 2.2.1. Let \( X: \Omega \to \mathbb{N}^* \) be a random variable. The pmf of the difference equation

\[
h_k(x+1) - h_k(x) = \frac{q^{x+1} \beta^{x+1}}{q^{x+1} \beta^{x+1}} - \frac{1}{\beta} q^{x+1} \beta^{x+1} \frac{x}{\beta} = \frac{1}{\beta} q^{x+1} \beta^{x+1} - 1
\]

With the boundary condition \( h_k(0) = \frac{1-q^{x+1}}{\beta q^{x+1}} \).

Proof. If has pmf (2), then clearly (7) holds. Now, if (7) holds, then for every \( x \in \mathbb{N} \), we have

\[
\sum_{k=0}^{\infty} \left[ h_k(x+1) - h_k(x) \right] = \sum_{k=0}^{\infty} \left[ \frac{q^{x+1} \beta^{x+1}}{q^{x+1} \beta^{x+1}} - \frac{1}{\beta} q^{x+1} \beta^{x+1} \frac{x}{\beta} \right] = \frac{1}{\beta} q^{x+1} \beta^{x+1} - 1
\]

In view of the fact that \( h_k(0) = \frac{1-q^{x+1}}{\beta q^{x+1}} \), from the last equation we have

\[
h_k(x) = \frac{q^{x+1} \beta^{x+1}}{q^{x+1} \beta^{x+1}} - \frac{1}{\beta} q^{x+1} \beta^{x+1} \frac{x}{\beta} - 1
\]

Which, in view of (3), implies that has pmf (2).

### 3. Concluding Remark

The problem of characterizing a distribution is an important one which can help the researcher to find out if their selected distribution is in fact the right one. This short note is intended to provide the characterizations of MDRMW distribution to complete, in some way, the work of Oloko et al. [1].
